# Rossi for You

## Innovation

Rossi offers a wide range of **solutions for an evolving industry**, flexible and innovative gearboxes and gearmotors for customer tailored solutions to maximize performance and minimize the total cost of ownership.

## High quality, 3 years warranty

Our drive is to innovate and boost operations by manufacturing performing, precise, reliable and high-quality products all over the world. We are always one step forward in offering and developing solutions that can satisfy an unlimited number of application needs, even in the most demanding conditions.

## Reliability

We are a reliable company with the right flexibility and know-how to respond to worldwide market requests, in all application fields, without leaving aside our commitment for the environment and value on human safety, to protect everyone's future.

## Tools and processes

We continue to invest in new tools and processes, so our highly skilled specialist team in different fields are supporting you to find the best solution suitable for your demands, always by your side on every step of the project.

## After-sale service

Highly trained mechanics and support teams can ensure a fast and efficient after-sale service providing support worldwide.

## Digital support

Alongside our 24/7 **Rossi for You** support portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

**70**  
YEARS

## Experience

Shaped by more than 60 years of history Rossi meets your unique needs whether you need a standard design or a customized solution.

# Global presence local service

## Local support

Sales, customer service,  
technical support, spare parts

17 branches\*

Worldwide distribution network\*

A global network of subsidiaries and dealers. From design and execution to after-sales service. Rossi is always close to you: a local, reliable and flexible partner.

Alongside our 24/7 **Rossi for You** portal you have a suite of digital support tools enabling real time access to your order tracking, invoices, spare part tables download and contact to our service.

# Features, benefits and range

## Maximum performance

Suitable for wide variety of applications

## Gear accuracy rating

High performance thanks to maximum gear accuracy rating

## Modularity

Modular product for customized solutions

## Reliability

Minimum maintenance, high efficiency and noiselessness

## Digitalization

**Rossi for You**, the digital platform always available

## Know-how

Our experience at your service

## Worm gear reducers

32 ... 81

**RV**  
with worm gear pair

**R IV**  
with 1 cylindrical gear pair plus worm

100 ... 250

## Worm gearmotors

32 ... 81

**MR V**  
with worm gear pair

**MR IV**  
with 1 cylindrical gear pair plus worm

100 ... 250

40 ... 81

**MR 2IV**  
with 2 cylindrical gear pairs plus worm

100 ... 126

## Combined gear reducer and gearmotors units

**RV + RV**

**RV + R IV**

**MR V + R 2I, 3I**

**MR IV + R 2I, 3I**

**RV + MR V**

**RV + MR IV**

**MR V + MR 2I, 3I**

**MR IV + MR 2I, 3I**

## Gear reducers and gearmotors (worm wheel)

**32 ... 50**

**63 ... 160**

**161**

**200, 250**

## Gear reducers (worm)

**32\* ... 161**

**200, 250**

## Gearmotors (worm)

**32\* ... 161**

**200, 250**

\*\* Size : double row angular contact ball bearing plus ball bearing.

\*\* For: MR V 32, 40 with motor size **63** (11x140) and **71** (14x160) (see ch. 2b),

MR V 50 with motor size **71** (14x160) and **80** (19x200) (see ch. 2b),

MR V 63 ... 81 with motor size **80** (19x200) and **90** (24x200) (see c. 2b), motor flange is usually integral with housing.

**Universal mounting** having **feet integral with housing** on 3 faces (sizes 32 .. 81) or on 2 faces (sizes 100 ... 250) and **B14 flange** on 2 faces. Design and strength of the casing permit **interesting shaft mounting solutions**

**Thickened size and performance gradation** (some sequential sizes are obtained with the same housing and many components in common)

**High, reliable and tested performances (Ni bronze); optimization of worm gear pair performances (ZI involute profile and adequately conjugate worm wheel profile)**

**Compactness, standardized dimensions and compliance with standards**

**Motor standardized to IEC**

**Rigid and precise cast iron single-piece housing**

**Generous internal space between train of gears and housing allowing:**

- high oil capacity;
- lower oil contamination;
- greater duration of worm wheel and worm bearings;
- lower running temperature.

32 ... 81

100 ... 250

**Possibility of fitting particularly powerful motors and transmitting high nominal and maximum torques**

**Improved and up-graded modular construction both for component parts and assembled product which ensures manufacturing and product management flexibility**

**High manufacturing quality standard**

**Possibility of obtaining multiple drives and at synchronous speed**

**Wide design and accessory availability:** shaft-mounting arrangements, mixed keying systems with key and locking elements (rings for sizes 32 ... 50, bush for sizes 63 ... 250), **reduced backlash**, etc.

## Reduced maintenance

A combination of modern concepts, analytical calculations carried out on **each single part**, use of the very latest machine tools, plus systematic checks on materials, assembling and workmanship, gives this series of gear reducers **high efficiency**, running **precision**, **regular motion** and **noiselessness**, **constant performance**, **life and reliability**, strength and overload withstanding and suitability for **heaviest applications**, wide size and ratio range, excellent service - **the advantages typically associated with high quality worm gear reducers produced in large series.**

## a - Gear reducer

### Structural features

Main specifications are:

- **universal mounting** having **feet integral with housing** (lower, upper feet and vertical on the face opposite to motor for sizes 32 ... 81; lower and upper feet for sizes 100 ... 250) and **B14 flange** (integral with housing for sizes 32 ... 50) on 2 faces of hollow low speed shaft output. **B5 flange** with spigot «recess» which can be mounted onto B14 flanges (see chap. 5). Design and strength of the housing permit **interesting shaft mounting solutions**;

\* concerning  $n_1 = 1400 \text{ min}^{-1}$  and transmission ratio stated in the scheme.  
 1) H, H<sub>0</sub> shaft height; D Ø low speed shaft end [mm]; M<sub>N2</sub>, M<sub>2, Grnd.</sub> torque [daN m]; F<sub>r2</sub> radial load [daN].

- thickened size (10 sizes with 4 size pairs with final centre distance 32 ... 250) and performance gradation; the size pairs are obtained with the same housing and with many components in common;
- gear reducer structure sized so as to accept particularly powerful motors – both MR V and MR IV – and to permit the transmission of high nominal and maximum torques at low output speeds, this being the particular advantage of worm gear pairs;
- gearmotor sizes 40 ... 126 with **2** cylindrical coaxial gear pair **first stage** in order to obtain high – **reversible** and irreversible – transmission ratios with standardized motor (63 ... 112) in a compact and economy way;
- normally, gearmotors MR V sizes 32, 40 (with motor sizes 63 and 71) 50 (with motor sizes 71 and 80) and 63 ... 81 (with motor sizes 80 and 90) have motor flange **integral** with the housing;
- hollow low speed shaft with keyway, and (sizes 63 ... 250) with circlip groove for removal purposes: in spheroidal cast iron (grey cast iron for sizes 32 and 40) integral with wormwheel (sizes 32 ... 161) or steel (sizes 200 and 250); standard (left or right extension) or double extension low speed shaft (see ch. 5).
- gear reducers: input face with machined surface (R V) or flange (R IV) and with fixing holes: wormshaft end with key, and reduced wormshaft end with circlip groove (the same as for R IV, MR IV, MR 2IV, MR V 160 ... 250 with coupling);
- gearmotors: **motor standardized to IEC directly** keyed into the worm (MR V), for motor sizes 200 ... 250 **patented** keying system to obtain easier installing and removing and avoid fretting corrosion; standardized motor with pinion directly mounted onto the shaft end (MR IV, MR 2IV);
- **fan cooling** (sizes 100 ... 250); use of **double extension worm-shaft** simply obtained by removing the fan cowl centre disc; for MR V 81 with motor 100 and 112, fan incorporated in motor mounting flange;
- bearings on worm: double row angular contact ball bearing plus ball bearing (size 32); face-to-face taper roller bearings (sizes 40 ... 161); paired back-to-back taper roller bearings plus one ball bearing (sizes 200 and 250);
- bearings on wormwheel: ball bearings (sizes 32 ... 160); taper roller bearings (sizes 161 ... 250);
- 200 UNI ISO 185 **cast iron single-piece housing** with transverse stiffening ribs, and high oil capacity;
- oil bath lubrication with **synthetic oil** (ch. 4) for «**long-life**» lubrication: units provided with one plug (sizes 32 ... 64) or two plugs (sizes 80 and 81) supplied **filled with oil**; with filler plug with **valve**, drain plug and level plug (sizes 100 ... 250) supplied **without oil**; sealed;
- **paint: external** coating in epoxy powder paint (sizes 32 ... 81) RAL 5010 ISO C3 H to ISO 12944-2 and 12944-1 or water based dual compound polyacrylic resin basis enamel (sizes 100 ... 250) RAL 5010 ISO C3 L to ISO 12944-2 and 12944-1 resistant to atmospheric and aggressive agents; suitable for further coats only with dual-compound products after degreasing and sanding; color blue RAL 5010 DIN 1843, other colors and/or painting cycles on request; **internal** protection with epoxy powder paint (sizes 32 ... 81) suitable to resist to synthetic oils or with synthetic paint (sizes 100 ... 250) suitable to resist synthetic oils.
- possibility of obtaining combined gear reducer and gearmotor units providing high transmission ratios with different train of gears depending on overall dimension, efficiency, and final output speed requirements.

## Train of gears:

- worm gear pair; 1 cylindrical gear pair plus worm; with 2 cylindrical gear pairs plus worm gear pair (garmotor only);
- worm gear pairs, with **whole-number** transmission ratios ( $i = 10 \dots 63$ ) **identical** for the different sizes;  $i = 7$  for MR V 32 ... 81;
- 10 sizes having 4 sizes pairs (standard and strengthened) with final reduction center distance to R 10 series (32 ... 250) for a total of **14 sizes**;
- nominal transmission ratios to R 10 series (10 ... 315; up to 16 000 for combined units);
- casehardened and hardened cylindrical worm in 16CrNi4 or 20 MnCr5 UNI 7846-78 steel (depending on size) with ground and **superfinished involute** profile (**ZI**);
- wormwheel with profile especially conjugate to the worm through hob optimization, with hub in spheroidal or grey cast iron (depending on size) and **Ni bronze** CuSn12Ni2-B (EN1982-98) gear rim with high pureness and controlled phosphor contents;
- casehardened and hardened cylindrical gear pair in 16CrNi4 UNI 7846-78 steel with ground profile and helical toothing;
- train of gear load capacity calculated for breakage and wear; thermal capacity verified.

## Specific standards:

- nominal transmission ratios and principal dimensions according to UNI 2016 standard numbers (DIN 323-74, NF X 01.001, BS 2045-65, ISO 3-73);
- basic rack to BS 721-83; involute profile (ZI) to UNI 4760/4-77 (DIN 3975-76), ISO/R 1122/2-69);
- shaft heights to UNI 2946-68 (DIN 747-67, NF E 01.051, BS 5186-75, ISO 496-73);
- fixing flanges B14 and B5 (the latter with spigot «recess») taken from UNIL 13501-69 (DIN 42948-65, IEC 72.2);
- medium series fixing holes to UNI 1728-83 (DIN 69-71, NF E 27.040, BS 4186-67, ISO/R 273);
- cylindrical shaft ends (long or short) to UNI ISO 775-88 (DIN 748, NF E 22.051, BS 4506-70, ISO/R775/88) with tapped butt-end hole to UNI 9321 (DIN 332 Bl. 2-70, NF E 22.056) excluding d-D diameter ratio;
- parallel keys to UNI 6604-69 (DIN 6885 Bl. 1-68, NF E 27.656 and 22.175, BS 4235.1-72, ISO/R 773-69) except for specific cases of motor-to-gear reducer coupling where key height is reduced;
- mounting positions taken from UNEL 05513-67 (DIN 42950-64, IEC 34;7);
- worm gear pair load capacity and efficiency to **BS 721-83** integrated with ISO/CD 14521.

**Lines of contact and area of action** determined by computer to check on each individual gear pair design.

Fan cowl centre disc removed so as to utilize double extension wormshaft.

**Gear reducer design UO2B:** reduced wormshaft end (also suitable for R IV, MR IV, MR 2IV, MR V 160 ... 250 with coupling). Double extension low speed shaft.

## b - Electric motor

Gearmotor dimensions and masses of present catalog (see ch. 3.8 and 3.10) refer to HB and HBZ motors (cat. TX).

- motor **standardized to IEC**;
- asynchronous three-phase, totally-enclosed, externally ventilated, with cage rotor;
- single polarity, frequency 50 Hz, voltage  $\Delta$  230 V Y 400 V (size  $\leq$  132),  $\Delta$  400 V (size  $\geq$  160);
- IP 55 protection, insulation class F, temperature rise class B;
- rated power delivered on continuous duty S1 (excluding some cases of motor sizes with power not according to standard; see specific documentation) and referred to nominal voltage and frequency; maximum ambient temperature 40 °C and altitude 1 000 m;
- capacity to withstand one or more overloads up to 1,6 times the nominal load for a maximum total period of 2 min per single hour;
- starting torque with direct on-line start at least 1,6 times the nominal one (it is usually higher);
- mounting position B5 and derivatives as shown in the following table;
- **suitable for inverter duty** (generous electromagnetic sizing, low-loss electrical stamping, phase separators, etc.)
- designs available for every application need: flywheel, independent cooling fan, independent cooling fan and encoder, etc.

### Constructive features of HBZ brake motor

- particularly strong construction to withstand braking stresses; **maximum reduction of noise level**;
- spring-loaded d.c. electromagnetic brake; feeding from the terminal box; brake can also be independently fed directly from the line;
- braking torque **proportioned** to motor torque (usually  $M_f \approx 2 M_N$ ) and adjustable by adding or removing spring pairs;
- possibility of high frequency of starting;
- quick and rapid stop;
- hand lever for manual release with automatic return (on request for size  $\leq$  160S); removable lever rod.

For other specifications and details see **specific documentation of cat. TX**

### Main coupling dimensions

Motor size	 IEC 60072 (UNEL 13117-17, DIN 43677 Bl. 1.A-65) Motor mounting position

## Short time duty (S2) and intermittent periodic duty (S3); duty cycles S4 ... S10

In case of a duty-requirement type S2 ... S10 the motor power can be increased as per the following table; starting torque keeps unchanged.

**Short time duty (S2).** — Running at constant load for a given period of time less than that necessary to reach normal running temperature, followed by a rest period long enough for motor's return to ambient temperature.

**Intermittent periodic duty (S3).** — Succession of identical work cycles consisting of a period of running at constant load and a rest period. Current peaks on starting are not to be of an order that will influence motor heat to any significant extent.

$$\text{Cyclic duration factor} = \frac{N}{N+R} \cdot 100\%$$

where:  $N$  being running time at constant load,  
 $R$  the rest period and  $N + R \leq 10$  min (if longer consult us).

Duty			Motor size <sup>1)</sup>		
			63 ... 90	100 ... 132	160 ... 280
<b>S2</b>	duration of running	<b>90 min</b>	1	1	1,06
		<b>60 min</b>	1	1,06	1,12
		<b>30 min</b>	1,12	1,18	1,25
		<b>10 min</b>	1,25	1,25	1,32
<b>S3</b>	cyclic duration factor	<b>60%</b>	1,12		
		<b>40%</b>	1,18		
		<b>25%</b>	1,25		
		<b>15%</b>	1,32		
<b>S4 ... S10</b>			consult us		

1) For motor sizes 90LC 4, 112MC 4, 132MC 4, consult us.

## Frequency 60 Hz

**Normal** motors up to size 132 wound for 50 Hz can be fed at 60 Hz; in this case speed increases by 20%. If input-voltage corresponds to winding voltage, power remains unchanged, providing that higher temperature rise values are acceptable, and that the power requirement is not unduly demanding, whilst starting and maximum torques decrease by 17%. If input-voltage is 20% higher than winding voltage, power increases by 20% whilst starting and maximum torques keep unchanged.

For **brake** motors see **specific literature**.

From size 160 upwards motors — both standard and brake ones — should be would for 60 Hz exploiting the 20% power increase as a matter of course.

## Power available with high ambient temperature or high altitude

When motor has to run at an ambient temperature higher than 40 °C or at altitude above sea level higher than 1 000 m, it has to be derated according to the following tables:

Ambient temperature [°C]	30	40	45	50	55	60	
$P/P_N$ [%]	106	100	96,5	93	90	86,5	
Altitude a.s.l. [m]	1 000	1 500	2 000	2 500	3 000	3 500	4 000
$P/P_N$ [%]	100	98	92	88	84	80	76

## Specific standards:

- nominal powers and dimensions to CENELEC HD 231 (IEC 72-1, DIN 42677, NF C51-120, BS 5000-10 and BS 4999-141) for mounting positions IM B5, IM B14 and derivatives;
- nominal performances and running specifications to CENELEC EN 60034-1 (IEC 34-1, CEI EN 60034-1, DIN VDE 0530-1, NF C51-111, BS EN 60034-1);
- protection to CENELEC EN 60034-5 (IEC 34-5, CEI 2-16, DIN EN 60034-5, NF C51-115, BS 4999-105);
- mounting positions to CENELEC EN 60034-7 (IEC 34-7, CEI EN 60034-7, DIN IEC 34-7, NF C51-117, BS EN 60034-7);
- balancing and vibration velocity (vibration under standard rating N) to CENELEC HD 53.14 S1 (IEC 34-14, ISO 2373 CEI 2-23, BS 4999-142); motors are balanced with half key inserted into shaft extension;
- cooling to CENELEC EN 60034-6 (CEI 2-7, IEC 34-6): standard type IC 411; type IC 416 for non-standard design with axial independent cooling fan.

## Asynchronous three-phase motors, brake motors

### HE - HB

Asynchronous three-phase motor

### HEZ - HBZ

Asynchronous three-phase **brake motor** with **d.c. brake**

### HBF

Asynchronous three-phase **brake motor** with **a.c. brake**

### HBV

Asynchronous three-phase **brake motor** with **d.c. safety brake**

Advanced design motors sharing the **same stator windings**, the same **rotors**, the same  **housings**, the same  **flanges**, the same performance, and the majority of technical solutions with its twin brake motor series (**HEZ, HBZ, HBF, and HBV**).

The generous electromagnetic sizing allow to achieve **high efficiency values** complying **with different energy saving regulations**:

– Efficiency class **IE3 (ErP)** for HB and HE;

– Efficiency class **IE3 (ErP)** for HEZ, on request for HBZ

The electric design (terminal block, name plate, etc.) has been studied to comply, as standard, also with **NEMA MG1-12** for the maximum application flexibility and facility.

The strength and the precision of mechanical construction, the generous bearings and the wide range of non-standard designs available on catalog make this motor particularly suitable for coupling with gearmotors.

Thanks to its outstanding **low noise, progressivity** and **dynamic** characteristics, it is specifically suitable for **coupling with gearmotor minimizing the dynamic overloads** deriving from **starting and braking phases** (especially in case of motion reversals) and maintaining a **very good braking torque value**.

The excellent **operation progressivity** - when starting and braking - is assured by the brake anchor which is less quick in the impact (compared to a.c. HBF) and by the slight quickness of d.c. brakes.

Offering a comprehensive **range of accessories and non-standard designs** in order to satisfy all possible gearmotor application fields.

The **high reactivity** typical of **a.c. brake** and the **high braking capacity** make this brake motor **particularly suitable for heavy duties** requiring **quick brakings** and a **high number of operations** (e.g.: lifts with high frequency of starting, usually for size > 132, and/or for jog operations).

Vice versa, its very **high dynamic characteristics** (rapidity and frequency of starting) **are not advisable for the use in gearmotor** coupling, especially when these features are not strictly necessary for the application (avoiding useless overloads on the whole transmission).

Comprehensive **range of accessories and non-standard designs** in order to satisfy all application needs of gearmotors (in particular for HBF: IP 56, IP 65, encoder, independent cooling fan, independent cooling fan and encoder, double extension shaft, etc.).

Featuring **maximum economy, very reduced overall dimensions and moderate braking torque**, it is suitable for the coupling with gearmotor and can be applied as brake for **safety or parking stops** (e.g. cutting machines) and for operations at deceleration ramp end **during the running with inverter**.

The standard cast iron fan supplies a flywheel effect increasing the very good progressivity of starting and braking (typical of d.c. brake) being particularly **suitable for «light»<sup>1)</sup> traverse movements**.

1) Mechanism group M4 (max 180 starts/h) and on-load running L1 (light) or L2 (moderate) to ISO 4301 /1, F.E.M. /II 1997.

# Symbols and units of measure

BS: British Standards Institution (BSI).

ISO: International Organization for Standardization.

2) Newton [N] is the force imparting an acceleration of 1 m/s<sup>2</sup> to a mass of 1 kg.

3) Kilogramme [kg] is the mass of the prototype kept at Sèvres (i.e. 1 dm<sup>3</sup> of distilled water at 4 °C).

4) Joule [J] is the work done when the point of application of a force of 1 N is displaced through a distance of 1 m.

# Product overview

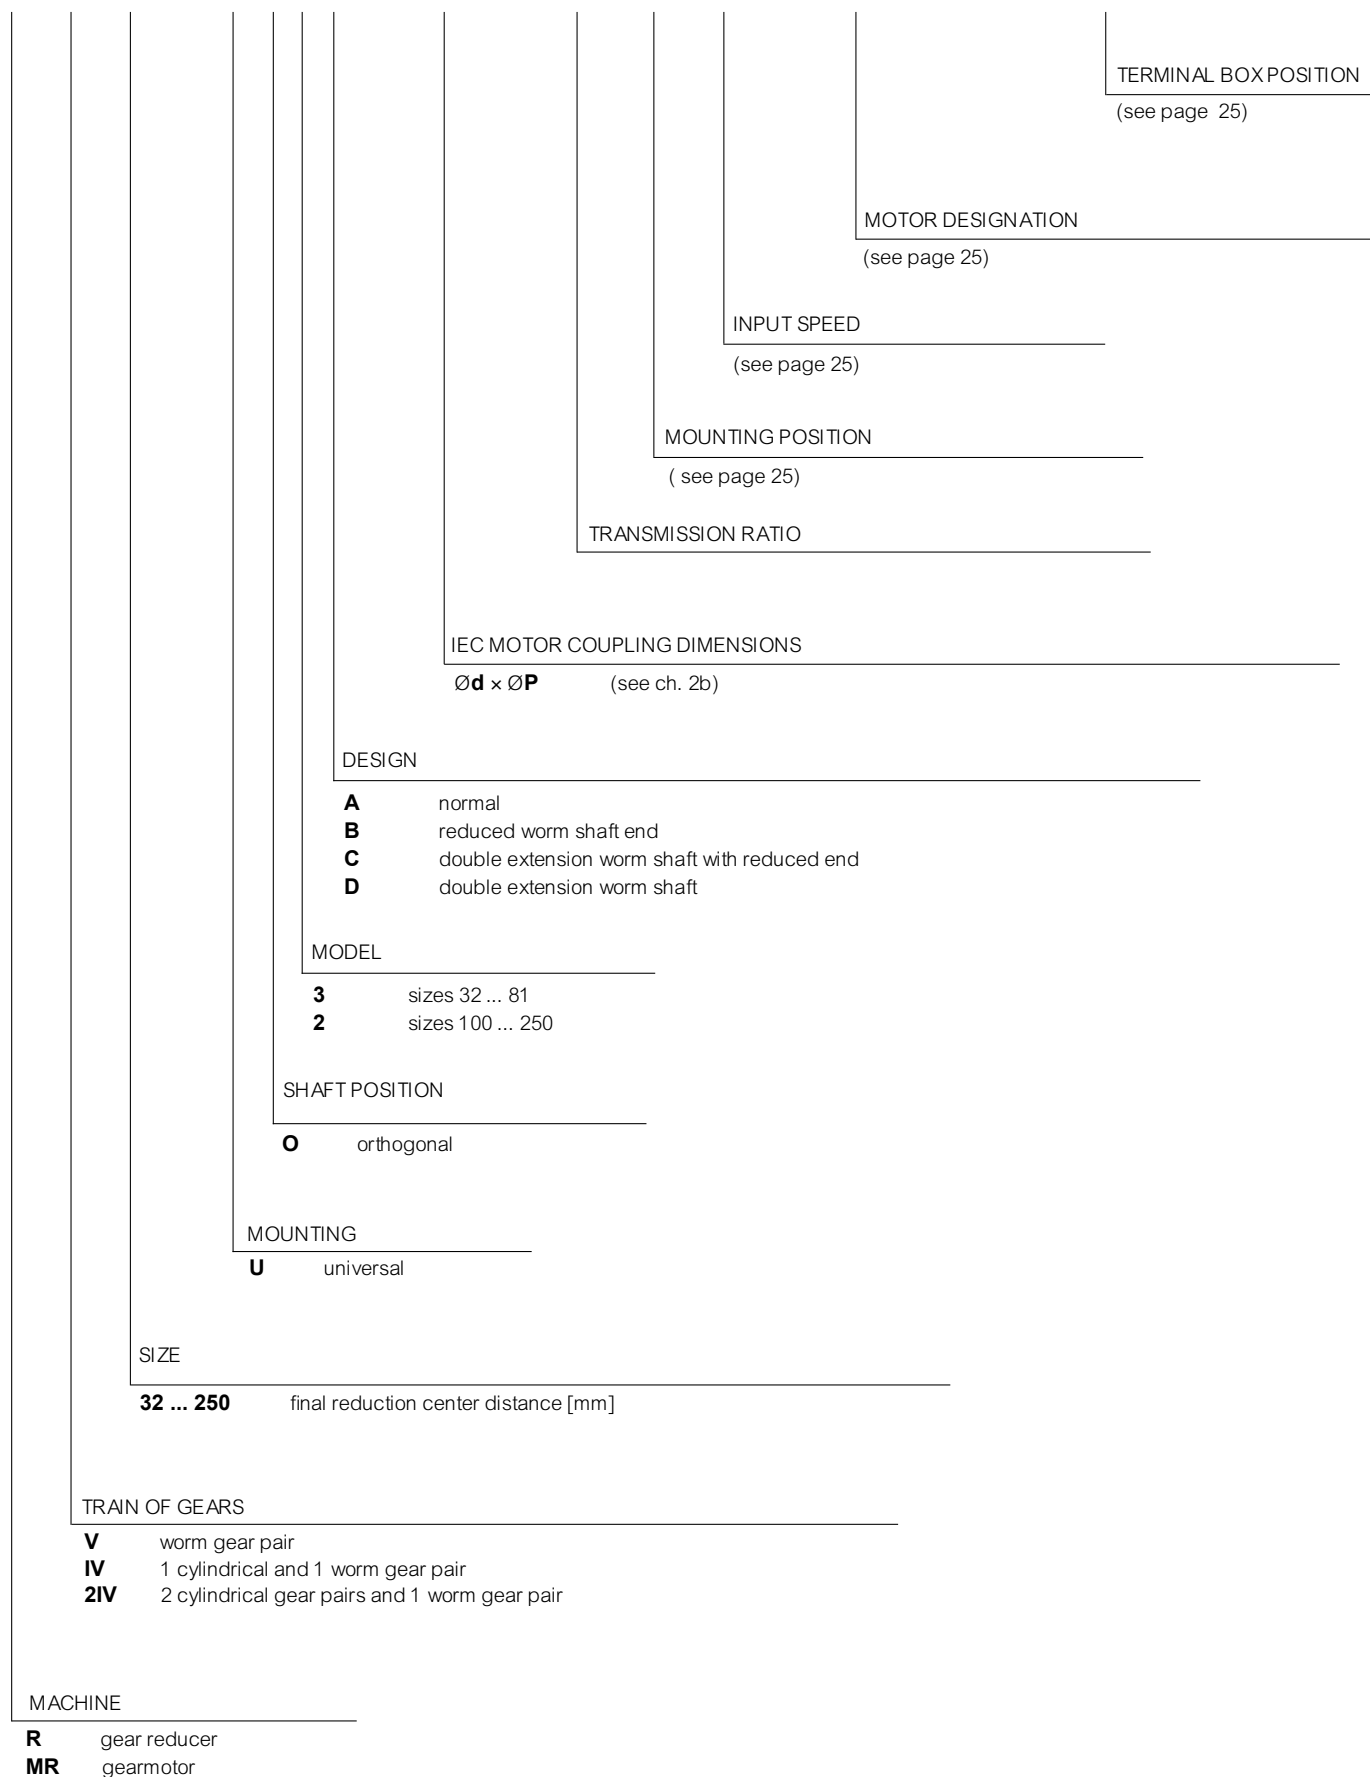

## Section content

3.1	Designation	24
3.2	Thermal power	26
3.3	Service factor	28
3.4	Selection	29
3.5	Nominal powers and torques	33
3.6	Designs, dimensions, mounting positions and oil quantities	40
3.7	Gearmotors selection tables	42
3.8	Designs, dimensions, mounting positions and oil quantities	60
3.9	Gear reducer and gearmotor combined units	65
3.10	Combined units dimensions	68
3.11	Radial loads on high speed shaft end	74
3.12	Radial and axial loads on low speed shaft end	74

## Designation code

**R V 250 U O 2 A - 50 B3**  
**MR V 80 U O 3 A - 24 × 200 - 25 V5 HB3 90L4 230.400-50 B5 TB3**

## Gear reducer mounting position

**Gear reducer and gearmotor mounting positions are described** in ch. 3.6, 3.8 (the mounting position designation refers to foot mounting only, even if gear reducers are for universal mounting; e.g.: B14 flange fastening and derivatives; B5 flange fastening and derivatives, see ch.5).

When having no particular needs, **prefer B3 mounting position** for its technical and economic cost effectiveness (maximum simplification of lubrication system, lower oil splash, lower gear reducer heating, stock availability).

## Input speed

Complete the designation stating the input speed  $n_1$ , in the following cases:

- $n_1 > 1400 \text{ min}^{-1}$ ;
- for gear reducer sizes 200 and 250 mounting position B7

Example:

R V 250 UO2A / 50  $n_1 = 560 \text{ min}^{-1}$ , **mounting position B7**

## Motor

When the gearmotor is supplied **equipped with a standard Rossi motor**, fill in the designation stating the motor designation (ref. cat. TX).

Example:

MR V 200 UO2A - 48 x 350 - 25

**HB3 180M 4 400-50 B5**

When **brake motor** is required, insert the letters **HBZ** (ref. cat. TX).

Example:

MR V 200 UO2A - 48 x 350 - 25

**HBZ 180M 4 400-50 B5**

When the gearmotor is equipped **without motor**, omit the designation and add «without motor».

Esempio:

MR V 200 UO2A - 48350 - 25

**without motor**

When motor is supplied by the **Buyer**<sup>1)</sup>, complete the designation by stating the description of «motor supplied by us».

1) The motor, supplied by the Buyer must be to IEC with mating surfaces machined under accuracy rating IEC 60072-1 and is to be sent carriage and expenses paid to our factory for fitting to the gear reducer.

Example:

MR V 200 UO2A - 48350 - 25

**motore supplied by us**

## Motor terminal box position

Complete the designation stating the motor terminal box position if differing from the standard one (TB0; see ch. 10 and scheme below); the cable input is Buyer's responsibility.

Example:

MR V 200 UO2A - 48350 / 25

HB3 180M 4 400-50 B5 **TB3**

View from drive end (D)

## Accessories and non-standard designs

In the event of a gear reducer or gearmotor being required in a design different from those stated above, specify it in detail (ch. 5).

Nominal thermal power  $P_{tN}$ , written in red in the tables in the following page, is that which can be applied at the gear reducer input without exceeding 95 °C<sup>1)</sup> approximately oil temperature when operating in following running conditions:

- input speed  $n_1 = 1\ 400\ \text{min}^{-1}$ ;
- mounting position B3;
- continuous duty S1;
- maximum ambient temperature 40 °C;
- maximum altitude 1 000 m above sea level;
- air speed  $\geq 1,25\ \text{m/s}$  (typical value in presence of a gearmotor with self cooled motor).

Wherever nominal thermal power  $P_{tN}$  is indicated in ch 3.5 and 3.7 it should be always verified that the applied power  $P_1$  is less than or equal to gear reducer nominal thermal power  $P_{tN}$  multiplied by the corrective coefficients  $f_2, f_3, f_4, f_5$  (stated in the following tables) considering the several operational conditions:

$$P_1 \leq P_{tN} \cdot f_2 \cdot f_3 \cdot f_4 \cdot f_5$$

When this condition is not satisfied consider the use of special lubricant or a cooling unit with heat exchanger: consult us.

Thermal power needs not be taken into account when maximum duration of continuous running time is 1 ÷ 3 h (from small to large gear reducer sizes) followed by rest periods long enough to restore the gear reducer to near ambient temperature (likewise 1 ÷ 3 h). In case of maximum ambient temperature above 50 °C or below 0 °C consult us.

Thermal factor  $f_2$  according to **ambient temperature** and **duty**

Maximum ambient temperature [°C]	Continuous duty <b>S1</b>	$f_2$			
		Intermittent duty <b>S3 ... S6</b>			
		Cyclic duration factor for 60 min running <sup>2)</sup>			
		<b>60</b>	<b>40</b>	<b>25</b>	<b>15</b>
<b>50</b>	0,8	0,95	1,06	1,18	1,32
<b>40</b>	<b>1</b>	1,18	1,32	1,5	1,7
<b>30</b>	1,18	1,4	1,6	1,8	2
<b>20</b>	1,32	1,6	1,8	2	2,24
<b>10</b>	1,5	1,8	2	2,24	2,5

Thermal factor  $f_3$  according to **mounting position**

Train of gears	$f_3$	
	Mounting position	
	<b>B3, B8, V5, V6</b>	<b>B6, B7</b>
<b>V</b>	1	0,9
<b>IV, 2IV</b>	1	1

Thermal factor  $f_4$  according to **altitude**

Altitude a.s.l [m]	$f_4$
$\leq 1\ 000$	<b>1</b>
<b>1 000 ÷ 2 000</b>	0,95
<b>2 000 ÷ 3 000</b>	0,9
<b>3 000 ÷ 4 000</b>	0,85
$\geq 4\ 000$	0,8

Thermal factor  $f_5$  according to **air speed** on the housing

Air speed m/s	Working environment	$f_5$
<b>&lt; 0,63</b>	very small or no air movement or gear reducer shielded	consult us
<b>0,63</b>	small and with limited air movement	0,71
<b>1</b>	large and without ventilation	0,9
<b>1,25</b>	large and with slight ventilation (e.g. gearmotor with self-cooled motor)	<b>1</b>
<b>2,5</b>	outdoor ventilated	1,18
<b>4</b>	strong air movement	1,32

1) Corresponding to an average temperature of the external housing surface of approximately 85 °C; locally housing temperature can achieve the oil temperature.  
7) (Duration of running on load / 60) · 100 [%].

Service factor  $f_s$  takes into account the different running conditions (nature of load, running time, frequency of starting, other considerations) which must be referred to when performing calculations of gear reducer selection and verification.

The powers and torques shown in the catalogue are nominal (i.e. valid for  $f_s = 1$ ) for gear reducers, corresponding to the  $f_s$  indicated for gearmotors.

Service factor based: on the nature of load and running time (this value is to be multiplied by the values shown in the tables alongside).

Service factor based on frequency of starting referred to the nature of load.

Nature of load of the driven machine		Running time [h]				
Ref.	Description	3 150 ≤ 2 h/d	6 300 2 ÷ 4 h/d	12 500 4 ÷ 8 h/d	25 000 8 ÷ 16 h/d	50 000 16 ÷ 24 h/d
<b>a</b>	<b>Uniform</b>	0,67	0,85	1	1,25	1,6
<b>b</b>	<b>Moderate overloads</b> (1,6 × normal)	0,85	1,06	1,25	1,6	2
<b>c</b>	<b>Heavy overloads</b> (2,5 × normal)	1	1,25	1,5	1,9	2,36

Load ref.	Frequency of starting z [starts/h]							
	4	8	16	32	63	125	250	500
<b>a</b>	1	1,06	1,12	1,18	1,25	1,32	1,4	1,5
<b>b</b>	1	1	1,06	1,12	1,18	1,25	1,32	1,4
<b>c</b>	1	1	1	1,06	1,12	1,18	1,25	1,32

Details of service factor and considerations.

Given  $f_s$  values are valid for:

- electric motor with cage rotor, direct on-line starting up to 9,2 kW, star-delta starting for higher power ratings; for direct on-line starting above 9,2 kW or for brake motors, select  $f_s$  according to a frequency of starting double the actual frequency; for internal combustion engines multiply  $f_s$  by 1,25 (multicylinder) or 1,5 (single-cylinder);
- maximum time on overload 15 s; on starting 3 s; if over and/or subject to heavy shock effect, consult us;
- a whole number of overload cycles (or start) **imprecisely** completed in 1, 2, 3 or 4 revolutions of low speed shaft; if **precisely** a continuous overloads should be assumed;
- **standard** level of reliability; if a **higher** degree of reliability is required (particularly difficult maintenance conditions, key importance of gear reducer to production, personnel safety, etc.) multiply  $f_s$  by **1,25 ÷ 1,4**.

Motors having a starting torque not exceeding nominal values (star-delta starting, particular types of motor operating on direct current, and single-phase motors), and particular types of coupling between gear reducer and motor, and gear reducer and driven machine (flexible, centrifugal, fluid and safety couplings, clutches and belt drives) affect service factor favourably, allowing its reduction in certain heavy-duty applications; consult us if need be.

## a - Gear reducer

### Determining the gear reducer size

- Make available all necessary data: required output power  $P_2$  of gear reducer, speeds  $n_2$  and  $n_1$ , running conditions (nature of load, running time, frequency of starting  $z$ , other considerations) with reference to ch. 3.3.
- Determine service factor  $f_s$  on the basis of running conditions (ch. 3.3).
- Select the gear reducer size (also, the train of gears and transmission ratio  $i$  at the same time) on the basis of  $n_2$ ,  $n_1$  and of a power  $P_{N2}$  greater than or equal to  $P_2 \cdot f_s$  (ch. 3.5).
- Calculate power  $P_1$  required at input side of gear reducer using — the formula  $\frac{P_2}{\eta}$ , where  $\eta = \frac{P_{N2}}{P_{N1}}$  is the efficiency of the gear reducer (ch. 3.5).

When for reasons of motor standardization, power  $P_1$  applied at input side of gear reducer turns out to be higher than the power required (considering motor/gear reducer efficiency), it must be certain that this excess power applied will never be required, and frequency of starting  $z$  is so low as not to affect service factor (ch. 3.3).

Otherwise, make the selection by multiplying  $P_{N2}$  by  $\frac{P_1 \text{ applied}}{P_1 \text{ required}}$

Calculations can also be made on the basis of torque instead of power; this method is even preferable for low  $n_2$  values.

### Verifications

- Verify possible radial loads  $F_{r1}$ ,  $F_{r2}$  and axial load  $F_{a2}$  by referring to instructions and values given in ch. 3.11 and 3.13.
- When the load chart is available, and/or there are overloads — due to starting on full load (mainly for high inertias and low transmission ratios), braking, shocks, irreversible or with low reversibility gear reducers in which the wormwheel becomes driving member due to the driven machine inertia, applied power higher than that required, other static or dynamic causes — verify that the maximum torque peak (ch. 3.13) is always less than  $M_{2max}$  (ch. 3.5); if it is higher or cannot be evaluated, in the above cases, install a safety device so that  $M_{2max}$  will never be exceeded.
- When nominal thermal power  $P_{tN}$  is indicated in red in ch. 3.5, verify that  $P_1 \leq P_t$  (ch. 3.2).

## b - Gearmotor

### Determining the gearmotor size

- Make available all necessary data: required output power  $P_2$  of gearmotor, speed  $n_2$ , running conditions (nature of load, running time, frequency of starting  $z$ , other considerations) with reference to ch. 3.3.
- Determine service factor  $f_s$  on the basis of running conditions (ch. 3.3).
- Select the gearmotor size on the basis of  $n_2$ ,  $f_s$ ,  $P_2$  (ch. 3.7).

When for reasons of motor standardization, power  $P_2$  available in catalog is much greater than that required, the gearmotor can be selected on the

basis of a lower service factor ( $f_s \cdot \frac{P_2 \text{ required}}{P_2 \text{ available}}$ )

provided it is certain that this excess power available will never be required and frequency of starting  $z$  is low enough not to affect service factor (ch. 3.3).

Calculations can also be made on the basis of torque instead of power; this method is even preferable for low  $n_2$  values.

### Verifications

- Verify possible radial load  $F_{r2}$  and axial load  $F_{a2}$  referring to directions and values given in ch. 3.12.
- For the motor, verify frequency of starting  $z$  when higher than that normally permissible, referring to directions and values given in ch. 2b; this will normally be required for brake motors only.
- Verify, in case of **motors supplied by the customer**, that the **static bending moment  $M_b$**  generated by motor weight on the counter flange of gear reducer is lower than the value allowed  $M_{bmax}$  stated in the ch. 3.13.  
**Loads higher than permissible loads may be present in dynamical applications** where the gearmotor is subjected to translations, rotations or oscillations (e.g.: **shaft mounting arrangements**): consult us for the study of every specific case

- When a load chart is available, and/or there are overloads — due to starting on full load (especially with high inertias and low transmission ratios), braking, shocks, irreversible or with low reversibility gear reducers in which the wormwheel becomes driving member due to the driven machine inertia, other static or dynamic causes — verify that the maximum torque peak (ch. 3.13) is always less than  $M_{2max}$  (ch. 3.5); if it is higher or cannot be evaluated, in the above instances, install suitable safety devices so that  $M_{2max}$  will never be exceeded.  $M_{2max}$  value can be read off in ch. 3.5 against the corresponding speed  $n_2$  and transmission ratio  $i$  of the worm gear pair.
- When nominal thermal power  $P_{tN}$  is indicated in red in ch. 3.7, verify that  $P_1 \leq P_t$  (ch. 3.2).

## c - Combined gear reducer and gearmotor units

Combined units are obtained by coupling together **normal single** gear reducers and/or gearmotors.

### Determining the final gear reducer size

- Make available all necessary data relating to the output of the final gear reducer: required torque  $M_2$  speed  $n_2$ , running conditions (nature of load, running time, frequency of starting  $Z$ , other considerations) with reference to ch. 3.3.
- Determine service factor  $f_s$  on the basis of running conditions (ch. 3.3) and of  $n_2$  (see \*, \*\* ch. 3.9).
- Select the final gear reducer size and the corresponding efficiency  $\eta$  (ch. 3.9, table A), on the basis of  $n_2$  and a torque value  $M_{N2}$  greater than or equal to  $M_2 \cdot f_s$  (the  $\eta$  value shown can be taken as valid even if the final gear reducer's train of gears is type IV).  
For  $f_s < 1$  verify that  $M_2 \leq M_{2\text{ Size}}$ .

### Determining the type of combined unit

- Select the final gear reducer basic reference, and the type and size of initial gear reducer or gearmotor (ch. 3.9 table B), on the basis of the final gear reducer size, and of the type of combined unit selected.

When selecting the type of unit, refer to the drawings in table B bearing in mind the following considerations:

**gear reducer:** gives greater operational flexibility; stress deriving from starting and heavy duty can be diminished thanks to the possibility of locating couplings (flexible, centrifugal, fluid, safety or friction type), belt drives, etc. between gear reducer and motor;

**gearmotor:** provides a more compact and economical solution compared to the equivalent gear reducer combined unit;

combined units **R V** + R V or MR V; **R V** + R IV or MR IV: input and output shafts can be either parallel or orthogonal, overall dimensions are kept to a minimum, especially within the plane perpendicular to the low speed shafts; these units are normally irreversible; the latter two types give higher transmission ratios than the former two types as well as higher efficiency, with the same transmission ratio;

combined units **MR V** + R 2l, 3l or MR 2l, 3l: input and output shafts are orthogonal, overall dimensions kept at minimum along the direction of the low speed shaft; high efficiency;

combined units **MR IV** + R 2l, 3l or MR 2l, 3l: the same as above but with the possibility of higher transmission ratios, and with overall dimensions of the initial gear reducer or gearmotor contained within those planes defined by the mounting feet.

## Selection of initial gear reducer or gearmotor

– Calculate the speed  $n_2$  and the required power  $P_2$  at the initial gear reducer or gearmotor output, using the following formulae:

$$n_2 \text{ initial} = n_2 \text{ final} \cdot i \text{ final}$$

$$P_2 \text{ initial} = \frac{M_2 \text{ final} \cdot n_2 \text{ final}}{955 \cdot \eta \text{ final}} [\text{kW}]$$

- In the case of gear reducer, establish input speed  $n_1$  at the input of the initial gear reducer.
- Make the selection of initial gear reducer or gearmotor as shown in ch. 3.4, paragraph a) or b) of this catalog (in the case of worm gear reducers and gearmotors), or of catalogue E (in the case of coaxial gear reducers and gearmotors), bearing in mind that sizes are pre-established (and cannot be changed on account of couplings being standard) and that it is not necessary to verify the service factor.

## Designation for ordering

When ordering combined units, the single gear reducers or gearmotors must be designed **separately**, as indicated in ch. 3.1 paragraph a) or b), of this catalog (for the final gear reducer and initial worm gear reducer or gearmotor) or of catalog E (for initial coaxial gear reducer or gearmotor), bearing in mind the following):

- for all combined units, insert the words **coupled with** between the final gear reducer designation and that of the initial gear reducer or gearmotor;
- in the case of **R V** + R V or MR V and **R V** + R IV or MR IV, select the initial gear reducer or gearmotor stating the coupling **position** where applicable (ch. 3.10);
- when ordering **MR V** + R 2l, 3l or MR 2l, 3l and **MR IV** + R 2l, 3l or MR 2l, 3l always add the words **without motor** to the final gear reducer designation and select for the initial gear reducer or gearmotor **oversized B5 flange** design (for size 63 also add – **Ø 28**); in case of initial gear reducer or gearmotor size 32 or 40 select **FC1A** flange design;
- in order to make easier the individualization of mounting position of initial gear reducer or gearmotor see ch. 3.10.

E.g: R V 100 UO2A/25  
coupled with  
R V 50 UO3A/32

R V 100 UO2A/25 mounting position V5  
coupled with  
MR V 50 UO3A – 14 160 – 50 pos. 3  
HB 71 A 4 230.400 B5

MR V 200 UO2A – 48 350 – 32 without motor  
coupled with  
R 2l 100 UC2A/29,3 oversized B5 flange

MR IV 200 UO2A – 138 300 – 81,8 without motor, mounting position B6, double extension low speed shaft  
coupled with  
MR 3l 80 UC2A – 19 200 – 49,8 mounting position V5  
oversized B5 flange  
HB3 80A 4 230.400 B5

## Considerations on selection

### Motor power

Taking into account the efficiency of the gear reducer, and other drives — if any — motor power is to be as near as possible to the power rating required by the driven machine: accurate calculation is therefore recommended.

The power required by the machine can be calculated, seeing that it is related directly to several requirements of the work to be carried out, to friction (starting, sliding or rolling friction) and inertia (particularly when mass and/or acceleration or deceleration are considerable). It can also be determined experimentally on the basis of tests, comparison with existing applications, or readings taken with amperometers or wattmeters.

An oversized motor would involve: a greater starting current and consequently larger fuses and heavier cable; a higher running cost as power factor ( $\cos \varphi$ ) and efficiency would suffer; greater stress on the drive, causing danger of mechanical failure, drive being normally proportionate to the power rating required by the machine, not to motor power.

Only high values of ambient temperature, altitude, frequency of starting or other particular conditions require an increase in motor power.

### Driving machines with high kinetic energy

When driving machines with high inertias and/or speeds, **avoid** the use of **irreversible** gear reducers or gearmotors, rather select a train of gears with higher efficiency (e.g. IV, 2IV in place of V), keeping the same transmission ratio, as stopping and braking can cause very high overloads (cap. 3.13).

### Drives with low input speed ( $n_1 < 355 \text{ min}^{-1}$ )

Wherever possible select the following transmission  $i=20$  for sizes 32 ... 50,  $i=25$  for sizes 63 ... 100,  $i=32$  for sizes 125 ... 200,  $i=40$  for size 250, these being the ratios capable of transmitting highest torque (for performance figures see table A ch. 11; for sizes 32 and 40, consult us).

### Input speed

For  $n_1$  higher than  $1\,400 \text{ min}^{-1}$ , **power** and **torque** ratings relating to a given transmission ratio vary as shown in the table alongside. In this case no loads should be imposed on the high speed shaft end.

For variable  $n_1$ , the selection should be carried out on the basis of  $n_{1 \text{ max}}$ ; but it should also be verified on the basis of  $n_{1 \text{ min}}$ .

When there is a belt drive between motor and gear reducer, different input speeds  $n_1$ , should be examined in order to select the most suitable unit from engineering and economy standpoints alike (our catalog favours this method of selection as it shows a number of input speed values  $n_1$  relating to a determined output speed  $n_{N2}$  in the same section).

Input speed should not be higher than  $1\,400 \text{ min}^{-1}$ , unless conditions make it necessary; better to take advantage of the transmission, and use an input speed lower than  $900 \text{ min}^{-1}$ .

$n_1$ $\text{min}^{-1}$	$P_{N2}$	$M_{N2}$
<b>2 800</b>	1,4	0,71
<b>2 240</b>	1,25	0,8
<b>1 800</b>	1,12	0,9
<b>1 400</b>	1	1

### Operation at 60 Hz

When motor is supplied at 60 Hz frequency (ch. 2 b), the gearmotor specifications vary as follows.

- Speed  $n_2$  increases by 20%.
- Power  $P_1$  may either remain constant or increase (ch. 2 b).
- Torque  $M_2$  and service factor  $f_s$  vary as follows:

$$M_{2 \text{ at } 60 \text{ Hz}} = M_{2 \text{ at } 50 \text{ Hz}} \cdot \frac{P_{1 \text{ at } 60 \text{ Hz}}}{1,2 \cdot P_{1 \text{ at } 50 \text{ Hz}}}$$

$$f_{s \text{ at } 60 \text{ Hz}} = f_{s \text{ at } 50 \text{ Hz}} \cdot \frac{1,12 \cdot P_{1 \text{ at } 50 \text{ Hz}}}{P_{1 \text{ at } 60 \text{ Hz}}}$$

$n_{N2}$	$n_1$	Train of gears <i>i</i>	P [kW] M [daN m]	Gear reducer size

Values in red state nominal thermal power  $P_{Tn}$  (ambient temperature 40 °C, continuous duty see ch. 3.2).

For  $n_1$  higher than 1 400 min<sup>-1</sup> or lower than 355 min<sup>-1</sup> see ch. 3.4 and page 32.

1) Values given for train of gears **IV** are nominal; see page 93 for effective transmission ratios.

2)  $M_{2max}$  represents maximum torque peak the gear reducer will withstand.

$n_{N2}$ $\frac{1}{\min^{-1}}$	$n_1$	Train of gears <i>i</i>	P [kW] M [daN m]	Gear reducer size

Values in red state nominal thermal power  $P_{tN}$  (ambient temperature 40 °C, continuous duty see ch. 3.2).

For  $n$ , higher than 1 400  $\min^{-1}$  or lower than 355  $\min^{-1}$  see ch. 3.4 and page 32.

1) Values given for train of gears **IV** are nominal; see page 93 for effective transmission ratios.

2)  $M_{2max}$  represents maximum torque peak the gear reducer will withstand.

Values in red state nominal thermal power  $P_{Tn}$  (ambient temperature 40 °C, continuous duty see ch. 3.2).

For  $n_1$ , higher than 1 400 min<sup>-1</sup> or lower than 355 min<sup>-1</sup> see ch. 3.4 and page 32.

1) Values given for train of gears **IV** are nominal; see page 93 for effective transmission ratios.

2)  $M_{2max}$  represents maximum torque peak the gear reducer will withstand.

Values in red state nominal thermal power  $P_{Tn}$  (ambient temperature 40 °C, continuous duty see ch. 3.2).  
For  $n_1$  higher than 1 400  $\text{min}^{-1}$  or lower than 355  $\text{min}^{-1}$  see ch. 3.4 and page 32.

1) Values given for train of gears **IV** are nominal; see page 93 for effective transmission ratios.

2)  $M_{2max}$  represents maximum torque peak the gear reducer will withstand.

## Summary of transmission ratios $i$ and torques valid for $n_1 \leq 90 \text{ min}^{-1}$

$M_{N2}$  and  $M_{2max}$  are the nominal torque and the peak torque, respectively, valid for  $n_1 \leq 90 \text{ min}^{-1}$ .

1) For these transmission ratios (which will transmit higher torques at lower speeds) torque increases further as  $n_1$  decreases, as stated in table A ch. 3.9; for sizes 32 and 40 consult us.  
 2) Gear ratio of input cylindrical gear pair.  
 3) For sizes 125 and 126 it is equal to 3,13.

- 1) Only for  $i \geq 16$ .
- 2) Working length of thread 2 · F.
- 3) Holes turned through 22° 30' with respect to the drawing.
- 4) Size 40: c<sub>1</sub> = 57,5; size 200: c<sub>1</sub> = 235; size 250: c<sub>1</sub> = 287.
- 5) Prearranged design for double extension worm shaft (see ch. 2).
- 6) Holes turned through 45° with respect to the drawing.
- 7) Tolerance t8.

- 1) Prearranged design for worm shaft extension (see ch. 2).
  - 2) Working length of thread 2 · F.
  - 3) Holes turned through 22° 30' with respect to the drawing.
  - 4) Holes turned through 45° with respect to the drawing.
  - 5) Tolerance t8.
  - 6) Square flange: for dimensions see ch. 15.
- \* When  $i_{w} \geq 200$  the shaft end will be:  
 size 100: d = 16, e = 30;  
 sizes 125, 126: d = 19, e = 40;  
 sizes 160 ... 200: d = 24, e = 50.

## Mounting positions - direction of rotation - and oil quantities [l]

Values in red state nominal thermal power  $P_{tn}$  (ambient temperature 40 °C, continuous duty, see ch. 3.2).

Motor (cat.TX) with efficiency value not according to IE3 class (IEC 60034-30).

Nominal power and nameplate data refer to intermittent periodic duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (see ch. 2b) in which case  $P_2$ ,  $M_2$  increase and  $f_s$  decreases proportionately.

2) For complete designation when ordering see ch. 3.1.

\* Mounting position B5R available also for mounting position B5 (see table ch. 2b).

$P_1$ kW 1)	$n_2$ min <sup>-1</sup>	$P_2$ kW	$M_2$ daN·m	$f_s$	Riduttore - Motore Gear reducer - Motor 2)	$i$

Values in red state nominal thermal power  $P_{Tn}$  (ambient temperature 40 °C, continuous duty, see ch. 3.2).

Motor (cat.TX) with efficiency value not according to IE3 class (IEC 60034-30).

Nominal power and nameplate data refer to intermittent periodic duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2... S10 (see ch. 2b) in which case  $P_2$ ,  $M_2$  increase and  $f_s$  decreases proportionately.

2) For complete designation when ordering see ch. 3.1.

\* Mounting position **B5R**, available also for mounting position **B5** (see table ch. 2b).

Values in red state nominal thermal power  $P_{th}$  (ambient temperature 40 °C, continuous duty, see ch. 3.2).

Motor (cat.TX) with efficiency value not according to IE3 class (IEC 60034-30).

Nominal power and nameplate data refer to intermittent periodic duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (see ch. 2b) in which case  $P_2$ ,  $M_2$  increase and  $f_s$  decreases proportionately.

2) For complete designation when ordering see ch. 3.1.

\* Mounting position **B5R** available also for mounting position **B5** (see table ch. 2b).

Values in red state nominal thermal power  $P_{th}$  (ambient temperature 40 °C, continuous duty, see ch. 3.2).

Motor (cat.TX) with efficiency value not according to IE3 class (IEC 60034-30).

Nominal power and nameplate data refer to intermittent periodic duty S3 70%.

1) Powers valid for continuous duty S1; increase possible for S2 ... S10 (see ch. 2b) in which case  $P_2$ ,  $M_2$  increase and  $f_s$  decreases proportionately.

2) For complete designation when ordering see ch. 3.1.

\* Mounting position **B5R** (see table ch. 2b).

Values in red state nominal thermal power  $P_{tn}$  (ambient temperature 40 °C, continuous duty, see ch. 3.2).

1) Powers valid for continuous duty S1; **increase** possible for S2 ... S10 (see ch. 2b) in which case  $P_2$ ,  $M_2$  increase and  $f_s$  decreases proportionately.

2) For complete designation when ordering see ch. 3.1.

\* Mounting position **B5R** (see table ch. 2b).

For initial gear reducer performance see: this catalog ch. 3.5 or 3.7 for worm gear reducer, and catalog E ch. 3.4 or 3.6 for coaxial gear reducer.

- 1) An anchor link is fitted between initial and final gear reducer.
- 2) The gearmotor has 140 mm motor mounting flange (dimension  $P_0$ , ch. 3.10).
- 3) The gearmotor has 160 mm motor mounting flange (dimension  $P_0$ , ch. 3.10).
- 4) Gear reducer in «oversized B5 flange» (see cat. E).

For initial gear reducer performance see: this catalog ch. 3.5 or 3.7 for worm gear reducer, and catalog E for coaxial gear reducer.

1) An anchor link is fitted between initial and final gear reducer.

4) Gear reducer in «oversized B5 flange» (see cat. E); size 63 has a low speed shaft reduced to 28 mm: «oversized B5 flange - Ø 28».

5) The gearmotor has 250 mm motor mounting flange (dimension  $P_{Dv}$ , ch. 3.10).

6) The gearmotor has 300 mm motor mounting flange (dimension  $P_{Dv}$ , ch. 3.10).

7) The gearmotor has 350 mm motor mounting flange (dimension  $P_{Dv}$ , ch. 3.10).

1) See catalogues for design, mounting position and oil quantities of single gear reducers.

2) The coupling position of the initial gear reducer with respect to the final one should be described in detail, though only in the case of 1, 2 or 3.

**Important:** personal safety-guards are the Buyer's responsibility (2006/42/EC).

1) Grease quantity is the same foreseen for B3 mounting position of cat. E.  
On name plate there is a \* in correspondence of mounting position.  
1) For initial worm gearmotor the motor terminal box position is always in TB3 position see ch. 3.1).

## Radial loads<sup>1)</sup> $F_{r1}$ [daN] on high speed shaft end 3.11

Radial loads generated on the shaft end by a drive connecting gear reducer and motor must be less than or equal to those given in the relevant table.

The radial load  $F_{r1}$  given by the following formula refers to most common drives:

$$F_{r1} = \frac{2\,865 \cdot P_1}{d \cdot n_1} \text{ [daN]} \quad \text{for timing belt drive}$$

$$F_{r1} = \frac{4\,775 \cdot P_1}{d \cdot n_1} \text{ [daN]} \quad \text{for V-belt drive}$$

where:  $P_1$  [kW] is power required at the input side of the gear reducer,  $n_1$  [ $\text{min}^{-1}$ ] is the speed,  $d$  [m] is the pitch diameter.

Radial loads given in the table are valid for overhung loads on centre line of high speed shaft end, i.e. operating at a distance of  $0,5 \cdot e$  ( $e$  = shaft end length) from the shoulder. If they operate at  $0,315 \cdot e$  multiply by 1,25; if they operate at  $0,8 \cdot e$  multiply by 0,8.

1) An axial load of up to 0,2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.

## Radial $F_{r2}$ or axial loads $F_{a2}$ [daN] on low speed shaft end 3.12

### Axial loads $F_{a2}$

Permissible  $F_{a2}$  is shown in the column where direction of rotation of low speed shaft (black or white arrow) and direction of the axial force (solid or broken arrow) correspond to those of the gear reducer in question. Direction of rotation and direction of force may be established viewing the gear reducer from any point, providing the same point adopted for both.

Wherever possible, choose the load conditions corresponding the column on the **right**

### Radial loads $F_{r2}$

Radial loads generated on the shaft end by a drive connecting gear reducer and machine must be less than or equal to those given in the relevant table.

Normally, radial loads on low speed shaft ends are considerable: in fact there is a tendency to connect the gear reducer to the machine by means of a transmission with high transmission ratio (economizing on the gear reducer) and with small diameters (economizing on the drive, and for requirements dictated by overall dimensions).

Bearing life and wear (which also affect gears unfavourably) and low speed shaft strength, clearly impose limits on permissible radial load.

The high value which radial load may take on, and the importance of not exceeding permissible values, make it necessary to take full advantage of the gear reducer's possibilities.

Permissible radial loads given in the table are therefore based on: the product of speed  $n_2$  [ $\text{min}^{-1}$ ] multiplied by bearing life  $L_n$  [h] required, the direction of rotation, the angular position  $\varphi$  [ $^\circ$ ] of the load and torque  $M_2$  [daN m] required.

Radial loads given in the table are valid for overhung loads on centre line of low speed shaft end, i.e. operating at a distance of  $0,5 \cdot E$  ( $E$  = shaft end length) from the shoulder. If operating at  $0,315 \cdot E$  multiply by 1,25; if operating at  $0,8 \cdot E$  multiply by 0,8.

# Radial $F_{r2}$ or axial loads $F_{a2}$ [daN] on low speed shaft end 3.12

Radial load  $F_{r2}$  for most common drives has the following value and angular position:

$$F_{r2} = \frac{1\,910 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for chain drive (lifting in general); for timing belt drive replace 1 910 with 2 865

$$F_{r2} = \frac{4\,775 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for V-belt drive

$$F_{r2} = \frac{2\,032 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for spur gear pair drive

$$F_{r2} = \frac{6\,781 \cdot P_2}{d \cdot n_2} \text{ [daN]}$$

for friction wheel drive (rubber-on-metal)

where:  $P_2$  [kW] is power required at the output side of the gear re-ducer,  $n_2$  [ $\text{min}^{-1}$ ] is the speed,  $d$  [m] is the pitch diameter.

**IMPORTANT:**  $0^\circ$  coincides with a half line lying parallel to the worm axis, and oriented as shown above, and therefore it follows the rotation of the worm axis as shown below.

1) An axial load of up to 0,2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.  
 2) A radial load of up to 0,2 times the value in the table is permissible, simultaneously with the axial load. If exceeded consult us.  
 3) Values valid for taper roller bearings on low speed shaft (ch. 5).

1) An axial load of up to 0,2 times the value in the table is permissible, simultaneously with the radial load. If exceeded consult us.  
 2) A radial load of up to 0,2 times the value in the table is permissible, simultaneously with the axial load. If exceeded consult us.  
 3) Values valid for taper roller bearings on low speed shaft (ch. 5).

## Worm gear pair

Number of teeth – wormwheel  $z_2$  and worm  $z_1$ , axial module  $m_x$ , reference lead angle  $\gamma_m$ , static efficiency  $\eta_s$  and worm gear pair moment of inertia  $J_1$  for gear reducers and gearmotors **R V**, **R IV**, **MR V**, **MR IV**, **MR 2IV**.

In the case of **R IV**, **MR IV** and **MR 2IV** gear reducers and gearmotors, the moment of inertia on the high speed shaft (disregarding motor) is that of the worm divided by the cylindrical gear pair total ratio squared.

$i$		Gear reducer size									
		32	40	50	63, 64	80, 81	100	125, 126	160, 161	200	250

## Low speed shaft angular backlash

**A rough guide** for low speed shaft angular backlash is given in the table (the worm being held stationary). Values vary according to design and temperature.

Gear reducers with **controlled** or **reduced backlash** can be supplied on request (see ch. 5), subject to longer delivery times and price addition; choose a **higher** service factor.

Gear reducer size	Angular backlash [rad] <sup>1</sup>	
	min	max
<b>32</b>	0,0030	0,0118
<b>40</b>	0,0025	0,0100
<b>50</b>	0,0020	0,0080
<b>63, 64</b>	0,0018	0,0071
<b>80, 81</b>	0,0016	0,0063
<b>100</b>	0,0013	0,0050
<b>125, 126</b>	0,0011	0,0045
<b>160, 161</b>	0,0010	0,0040
<b>200</b>	0,0008	0,0032
<b>250</b>	0,0007	0,0028

<sup>1</sup> At a distance of 1 m from the low speed shaft centre, angular backlash in mm is obtained multiplying the table value by 1 000 (1 rad = 3438').

## Gear ratio of input helical gear stage (garmotors MR IV, MR 2IV)

The partial transmission ratio of input helical gear stage is given in the table; this ratio has to be used when calculating the input speed of the intermediate worm shaft.

$i_N$	MR IV gearmotor size

1) Motor coupling dimensions valid for gearmotor size 100.  
 2) Partial transmission ratio of input helical gear stage.  
 3) With motor size 180 values are 128 and 2,56 respectively.

## Efficiency $\eta$

Efficiency  $\eta$  is derived from the  $P_{N2} / P_{N1}$  ratio in the case of gear reducers (ch. 3.5) and  $P_2 / P_1$  in the case of gearmotors (ch. 9). The values obtained will be valid assuming normal working conditions, worm operating as driving member, proper lubrication, adequate running-in (ch. 4), and a load near to the nominal value.

During the **initial working period** (about 50 hours) and generally at every cold start, efficiency will be lower (by about 12% for worms with  $z_1 = 1$ ; 6% for worms with  $z_1 = 2$  and 3% for worms with  $z_1 = 3$ ).

«**Static**» efficiency  $\eta_s$  on starting (see table in the preceding section) is much lower than  $\eta$  («starting friction») must be overcome at speed 0; as speed picks up gradually, efficiency will rise correspondingly until the catalogue value is reached.

**Inverse efficiency**  $\eta_{inv}$  – produced by the wormwheel as driver – is always less than  $\eta$ . It can be calculated approximately as follows:

$$\eta_{inv} \approx 2 - 1 / \eta; \quad \text{likewise:} \quad \eta_{s\ inv} \approx 2 - 1 / \eta_s$$

## Irreversibility

A worm gear reducer or gearmotor is **dynamically irreversible** (that is, it ceases to turn the instant the wormshaft receives no further stimulus that would keep the worm itself in rotation e.g. motor torque, inertia from the worm and related fan, motor flywheels, couplings, etc.) when  $\eta < 0,5$  as  $\eta_{inv}$  then drops below 0.

This state becomes necessary wherever there is a **need for stopping and holding** the load, even without the aid of a brake. Where continuous vibration occurs, dynamic irreversibility may not be obtainable.

A gear reducer or gearmotor is **statically irreversible** (that is, rotation cannot be imparted by way of the low speed shaft) when  $\eta_s < 0,5$ . This is a state **necessary to keep the load at standstill**; taking into account, however, that efficiency can increase with time spent in operation, it would be advisable to assume  $\eta_s \leq 0,4$  ( $\gamma_m < 5^\circ$ ).

Where continuous vibration occurs, static irreversibility may not be obtainable.

A gear reducer or gearmotor has **low static reversibility** (i.e. rotation may be imparted by way of the low speed shaft with high torque and/or vibration) when  $0,5 < \eta_s \leq 0,6$  ( $7^\circ - 30^\circ < \gamma_m \leq 12^\circ$ ).

A gear reducer or gearmotor has **complete static reversibility** (i.e. rotation may be imparted by way of the low speed shaft) when  $\eta_s > 0,6$  ( $\gamma_m > 12^\circ$ ).

This state is advisable where there is a **need for easy start-up of the gear reducer by way of the low speed shaft**.

## Overloads

Since worm gear pairs are often subject to high static and dynamic overloads by dint of the fact that they are especially suited to bear them, the need arises – more so than with other gear pairs – for verifying that such overloads will always remain lower than  $M_{2max}$  (ch. 3.5).

Overloads are normally generated when one has:

- starting on full load (especially for high inertias and low transmission ratios), braking, shocks;
- irreversible gear reducers, or gear reducers with low reversibility in which the wormwheel becomes driver due to driven machine inertia;
- applied power higher than that required; other static or dynamic causes.

The following general observations on overloads are accompanied by some formulae for carrying out evaluations in certain typical instances.

Where no evaluation is possible, install safety devices which will keep values within  $M_{2max}$ .

## Starting torque

When starting on full load (especially for high inertias and low transmission ratios) verify that  $M_{2max}$  is equal to or greater than starting torque, by using the following formula:

$$M_2 \text{ start} = \left( \frac{M_{\text{start}}}{M_N} \cdot M_2 \text{ available} - M_2 \text{ required} \right) \frac{J}{J + J_0 \cdot \eta} + M_2 \text{ required}$$

where:

$M_2$  required is torque absorbed by the machine through work and friction;

$M_2$  available is output torque derived from the motor's nominal power rating;

$J_0$  is the moment of inertia (of mass) of the motor;

$J$  is the external moment of inertia (of mass) in  $\text{kg m}^2$  (gear reducers, couplings, driven machine) referred to the motor shaft;

for other symbols see ch. 2b.

NOTE: When seeking to verify that starting torque is sufficiently high for starting, take into account efficiency  $\eta$  when evaluating  $M_2$  available, and starting friction, if any, in evaluating  $M_2$  required.

## Stopping machines with high kinetic energy (high moments of inertia combined with high speeds) with or without braking (braking applied to wormshaft, or use of brake motor)

Select a gear reducer with static reversibility ( $\eta_s > 0,5$ ); if using a brake motor, verify braking stress with the following formula:

$$\left( \frac{Mf}{\eta_{s \text{ inv}}} \cdot i + M_2 \text{ required} \right) \frac{J}{J + J_0 / \eta_{s \text{ inv}}} - M_2 \text{ required} \leq M_{2 \text{ max}}$$

where:

$Mf$  is the braking torque setting (see table in ch. 2b).

$\eta_{s \text{ inv}}$  is static inverse efficiency (see previous heading);

for other symbols see above and ch.1.

Where selection of a statically reversible gear reducer is not possible (i.e.  $\eta_s \leq 0,5$ ) slowing-down should be sufficiently gradual (avoiding application of excessive stress to the unit itself) as to ensure that:

$$\frac{J_2 \cdot \alpha_2}{10} - M_2 \leq M_{2 \text{ max}}$$

where:

$J_2$  [ $\text{kg m}^2$ ] is the moment of inertia (of mass) of the driven machine referred to the gear reducer's low speed shaft;

$M_2$  [ $\text{daN m}$ ] is torque absorbed by the machine through work and friction;

$\alpha_2$  [ $\text{rad/s}^2$ ] is the low speed shaft's angular deceleration; this may be reduced by flywheel fitted to the wormshaft, electric deceleration ramps, lowering of braking torque when braking systems are in use, etc.

$\alpha_2$  may be arrived at theoretically (within broadly safe limits) or experimentally (by testing against stopping time and distance etc.).

If a brake motor is in use, the following formula may be used for a safe evaluation of  $\alpha_2$ :

$$\alpha_2 = \frac{10 \cdot Mf}{J_0 \cdot i}$$

in which the motor is presumed without load and subject to its braking torque setting  $Mf$  [ $\text{daN m}$ ] (see table in ch. 2b).

## Operation with brake motor

**Stating time  $t_a$  and revolutions of motor  $\varphi_{a_1}$**

$$t_a = \frac{(J_0 + J/\eta) \cdot n_1}{95,5 \left( M_{\text{start}} - \frac{M_2 \text{ required}}{i \cdot \eta} \right)} \text{ [s];} \quad \varphi_{a_1} = \frac{t_a \cdot n_1}{19,1} \text{ [rad]}$$

**Braking time  $t_f$  and revolutions of motor  $\varphi_{f_1}$**

$$t_f = \frac{(J_0 + J/\eta_{\text{inv}}) \cdot n_1}{95,5 \left( M_{f+} - \frac{M_2 \text{ required} \cdot \eta_{\text{inv}}}{i} \right)} \text{ [s];} \quad \varphi_{f_1} = \frac{t_f \cdot n_1}{19,1} \text{ [rad]}$$

where:

$M_{\text{start}}$  [daN m] is motor starting torque  $\left( \frac{955 \cdot P_1}{n_1} \cdot \frac{M_{\text{start}}}{M_N} \right)$  (see ch. 2b);  
 $M_{f+}$  [daN m] is the braking torque setting of the motor (see ch. 2b);  
 for other symbols see above and ch. 1.

With the gear reducer run in and operating at normal running temperature — assuming a regular air-gap and ambient humidity and utilizing suitable electrical equipment — repetition of the braking action, as affected by variation in temperature of the brake and by the state of wear of friction surface, is approx  $\pm 0,1 \cdot \varphi_{f_1}$ .  
 During warm-up (1 ÷ 3 h, small through to large sizes), braking times and distances tend to increase to the point of stabilizing at or around values corresponding to rated catalogue efficiency.

## Duration of friction surface

As a rough guide, the number of applications permissible between successive adjustments of the air-gap is given by the following formula:

$$\frac{W \cdot 10^5}{M_f \cdot \varphi_{f_1}}$$

where:

$W$  [MJ] is the work of friction between successive adjustments of the air-gap as indicated in the table. For other symbols see above.

The air-gap should measure between 0,25 minimum and 0,7 maximum; as a rough guide, 5 adjustments can be made.

1) Working length of thread 1,25 · F.

## Fixing bolt dimensions for gear reducer feet

1) When tightening bolts at the fan side (sizes 100 ... 250) the fan cowl (which must enclose the fan assembly in order to enhance air-flow) needs to be removed for the purpose. When installing, ensure the cowl clears any surrounding walls by at least half the gear reducer's centre distance.

<b>60</b>	18 × 11 × 140	18	7	64,4
<b>70</b>	20 × 12 × 180	20	7,5	74,9
<b>75</b>	20 × 12 × 180	20	7,5	79,9
<b>90</b>	25 × 14 × 200	25	9	95,4
<b>110</b>	28 × 16 × 250	28	10	116,4

\* Recommended length.

1) Tolerance valid only for high speed shaft end. Diameter D tolerance for low speed shaft end (ch. 5) is **h7** for D ≤ 60, **j6** for D ≥ 70.

2) Values in brackets are for short shaft end.

## Shaft end of driven machine

Dimensions of shaft end to which the gear reducer's hollow shaft is to be keyed are those recommended in the table on following page and shown in the figures below.

Sizes 32 ... 50: fitting with key (fig. a) or fitting with key and locking rings (fig. b).

Sizes 63 ... 250: fitting with key (fig. c) or fitting with key and locking bush (fig. d); see also ch.4 and 5.

In the case of cylindrical shaft end with only diameter D (fig. a, c), for the seat D on input side, we recommend tolerance h6 or j6 instead of j6 or k6 to facilitate mounting.

**Important** the shoulder diameter of the shaft end of the driven machine abutting with the gear reducer must be at least  $(1,18 \div 1,25) \cdot D$ .

Gear reducer size	D	D <sub>3</sub>	E	E <sub>0</sub>	E <sub>1</sub>	E <sub>2</sub>	E <sub>3</sub>	l	m	m <sub>0</sub>	n	r

## Maximum bending moment of flange MR

In case of assembly of motors supplied by the customer, verify that the static bending moment  $M_b$  generated by motor weight on the counter flange of gear reducer is lower than the value allowed  $M_{bmax}$  stated in the table:

$$M_b \leq M_{bmax}$$

where:

$$M_b = G \cdot (X + HF) / 1000 \text{ [daN m]}$$

G [daN] motor weight; numerically nearly equal to motor mass, expressed in kg

X [mm] distance from motor center of gravity from flange surface

HF [mm] given in the table, according to gear reducer size and flange diameter  $P_1$ .

Very long and thin motors, though with bending moments within the prescribed limits, may generate anomalous vibrations during the operation. In these cases it is necessary to foresee a proper additional motor support (see motor specific documentation).

**Loads higher than permissible loads may be present in dynamical applications** where the gearmotor is subjected to translations, rotations or oscillations (e.g.: **shaft mounting arrangements**): consult us for the study of every specific case

Max allowable bending moment to  $M_{bmax}$  and HF dimension

# Installation and maintenance

## Section content

4.1	General	102
4.2	Lubrication	104
4.3	Shaft mounting arrangements	105
4.4	Motor replacement	106

## 4.1- General

Be sure that the structure on which gear reducer or gearmotor is fitted is plane, levelled and sufficiently dimensioned in order to assure fitting stability and vibration absence, keeping in mind all transmitted forces due to the masses, to the torque, to the radial and axial loads.

Position the gear reducer or gearmotor so as to allow a free passage of air for cooling both gear reducer and motor (especially at gear reducer and motor fan sides).

Avoid: any obstruction to the air-flow; heat sources near the gear reducer that might affect the temperature of cooling-air and of gear reducer for radiation; insufficient air recycle or any other factor hindering the steady dissipation of heat.

Mount the gear reducer so as not to receive vibrations.

When external loads are present use pins or locking blocks, if necessary.

When fitting gear reducer and machine and/or gear reducer and eventual flange **B5** it is recommended to use **locking adhesives** such as LOCTITE on the fastening screws (also on flange mating surfaces).

For outdoor installation or in a hostile environment protect the gear reducer or gearmotor with anticorrosion paint. Added protection may be afforded by water-repellent grease (especially around the rotary seating of seal rings and the accessible zones of shaft end).

Gear reducers and gearmotors should be protected wherever possible, and by whatever appropriate means, from solar radiation and extremes of weather; weather protection **becomes essential** when high or low speed shafts are vertically disposed, or where the motor is installed vertical with fan uppermost.

For ambient temperatures greater than 40 °C or less than 0 °C, consult us.

Before wiring-up the gearmotor, make sure that motor voltage corresponds to input voltage. If the direction of rotation is not as desired, invert two phases at the terminals.

Star-delta starting should be adopted for starting on no load (or with a very small load) and/or when the necessity is for smooth starts, low starting current and limited stresses.

If overloads are imposed for long periods of time, or if shocks or danger of jamming are envisaged, then motor-protections, electronic torque limiters, fluid couplings, safety couplings, control units or other suitable devices should be fitted.

Where duty cycles involve a high number of starts on-load, it is advisable to utilize **thermal probes** (fitted on the wiring) for motor protection; a thermal overload relay is unsuitable since its threshold must be set higher than the motor's nominal current rating.

Use varistors to limit voltage peaks due to contactors.

**Caution! Bearing life, good shaft and coupling running depend on alignment precision between the shafts.** Carefully align the gear reducer with the motor and the driven machine (with the aid of shims if need be), interposing flexible couplings whenever possible.

Whenever a leakage of lubricant could cause heavy damages, increase the frequency of inspections and/or envisage appropriate control devices (e.g.: remote oil level gauge, lubricant for food industry, etc.).

In polluting surroundings, take suitable precautions against lubricant contamination through seal rings or other.

Gear reducer or gearmotor should not be put into service before it has been incorporated on a machine which is conform to 2006/42/EC directive.

For brake or special motors, consult us for specific information.

### Fitting of components to shaft ends

It is recommended that the bore of parts keyed to shaft ends is machined to H7 tolerance; G7 is permissible for high speed shaft ends  $D \geq 55$  mm, provided that load is uniform and light; for low speed shaft ends, tolerance must be **K7** when load is not uniform and light. Other details are given in the «Shaft end» table (ch. 3.13).

Before mounting, clean mating surfaces thoroughly and lubricate against seizure and fretting corrosion.

Installing and removal operations should be carried out with **pullers** and **jacking screws** using the tapped hole at the shaft butt-end; for H7/m6 and K7/j6 fits it is advisable that the part to be keyed is pre-heated to a temperature of  $80 \div 100$  °C.

## Hollow low speed shaft

For the shaft end of machines where the hollow shaft of the gear reducer is to be keyed, j6 or k6 tolerances are recommended (according to requirements). Other details are given under «Shaft end» and «Shaft end of driven machine» (ch. 3.13).

In order to have an easier installing and removing of gear reducer sizes 63 ... 250 (with circlip groove) proceed as per the drawings a, b, respectively.

The system illustrated in the fig. c, d is good for axial fastening.

For sizes 63 ... 250, when shaft end of driven machine has no shoulder a spacer may be located between the circlip and the shaft end itself (as in the lower half of the fig. d).

The use of **locking rings** (sizes 32 ... 50, fig. e), or of **locking bush** (sizes 63 ... 250, fig. f) will permit easier and more accurate installing and removing and to eliminate backlash between key and keyway.

The locking rings or the locking bush are fitted after mounting, the shaft end of the driven machine must be as prescribed at ch. 3.13. Do not use molybdenum bisulphide or equivalent lubricant for the lubrication of the parts in contact. We recommend the use of a **locking adhesive** such as LOCTITE 601. For vertical ceiling-type mounting, contact us.

A **washer** for installing, removing (excluding sizes 32 ... 50) and axial fastening of gear reducer (ch. 5) with or without **locking rings** or **locking bush** (dimensions shown in the table) and a **protection cap** for the hollow low speed shaft can be supplied on request. Parts in contact with the circlip must have sharp edges.

3) Tightening torque for locking rings or bush.

## 4.2 - Lubrication

Gear pairs and bearings on worm are oil-bath lubricated; sizes 200 and 250 mounting position B7 with worm speed  $> 710 \text{ min}^{-1}$  have upper bearings on worm lubricated by a pump inside the casing. Other bearings are likewise lubricated by oil-bath, or splashed, with the exception of upper-bearings on wormwheel in mounting position V5 and V6, where life-grease lubrication is employed (NILOS ring in sizes 161 ... 250).

**All sizes** are envisaged with **synthetic oil** lubrication.

Synthetic oil can withstand temperature up to **95 ÷ 110 °C**.

**Sizes 32 ... 81:** gear reducers are supplied filled with synthetic oil (KLÜBER Klübersynth GH 6-320, MOBIL Glygoyle 320, SHELL Omala S4 WE 320; when worm speed  $< 280 \text{ min}^{-1}$  KLÜBER Klübersynth GH 6-680), providing **«long life»** lubrication, assuming pollution-free surroundings; quantities as indicated in ch. 8 and 10, and on the lubrication plate. Ambient temperature  $0 \div 40 \text{ °C}$  with peaks of  $-20 \text{ °C}$  and  $+50 \text{ °C}$ .

**Important:** verify mounting position keeping in mind that if gear reducer is installed in a mounting position which differs from the one indicated on the name plate, it could require the addition of the difference between the two quantities of lubricant given in ch. 3.6 and 3.8, by way of the housing filler hole.

**Sizes 100 ... 250:** gear reducers are supplied without oil; before putting into service, fill to the specified level<sup>1)</sup> with polyglycol basis (PAG) synthetic oil having the ISO viscosity-grade given in the table. Under normal conditions, the first speed range is for train of gears **V**, the second **IV** and **V**, (low speed), and the third **combined units** and **V, IV, 2IV** (low speed).

1) Lubricant quantities stated on ch. 3.6 and 3.8 are approximate for provisioning. The exact oil quantity the gear reducer is to be filled with is definitely given by the level.

Produttore Manufacturer	Olio sintetico PAG PAG synthetic oil

FUCHS	Renolin PG
KLÜBER	Klübersynth GH6
MOBIL	Mobil Glygoyle
SHELL	Omala S4 WE
TEXACO	Synlube CLP
TOTAL	Carter SY

ISO viscosity grade

Mean kinematic viscosity [cSt] at  $40 \text{ °C}$ .

Velocità vite Worm speed $\text{min}^{-1}$	Temperatura ambiente $0 \div 40 \text{ °C}$ <sup>1)</sup> – Olio sintetico / Ambient temperature $0 \div 40 \text{ °C}$ <sup>1)</sup> – Synthetic oil					
	Grandezza riduttore - Gear reducer size					
	100	125 ... 161		200, 250		
		B3, V5, V6	B6, B7, B8	B3, V5, V6	B6, B7, B8	
<b>2 800 ÷ 1 400</b> <sup>2)</sup>	320	320	220	220		
<b>1 400 ÷ 710</b> <sup>2)</sup>	320	320		320	220	
<b>710 ÷ 355</b> <sup>2)</sup>	460	460		460	320	
<b>355 ÷ 180</b> <sup>2)</sup>	680	680	460	460		
<b>&lt; 180</b>	680	680		680		

1) Peaks of  $10 \text{ °C}$  above and  $10 \text{ °C}$  ( $20 \text{ °C}$  for  $\leq 460 \text{ cSt}$ ) below the ambient temperature range are acceptable.

2) For these speeds we advise to replace oil after running-in.

**Combined gear reducer and gearmotor units:** lubrication remains independent, thus data relative to each single gear reducer hold good.

An overall guide to **oil-change interval**, is given in the table, and assumes pollution-free surroundings. Where heavy overloads are present, halve the value.

Temperatura olio [°C]	Intervallo di lubrificazione [h] - Olio sintetico	Oil temperature [°C]	Oil-change interval [h] - Synthetic oil
<b><math>\leq 65</math></b>	18 000	<b><math>\leq 65</math></b>	18 000
<b>65 ÷ 80</b>	12 500	<b>65 ÷ 80</b>	12 500
<b>80 ÷ 95</b>	9 000	<b>80 ÷ 95</b>	9 000
<b>95 ÷ 110</b>	6 300	<b>95 ÷ 110</b>	6 300

Never mix different makes of synthetic oil; if oil-change involves switching to a type different from that used hitherto, then give the gear reducer a thorough clean-out.

**Running-in:** a period of about  $400 \div 1\,600 \text{ h}$  is advisable, by which time the gear pair will have reached maximum efficiency (ch. 3.13); oil temperature during this period is likely to reach higher levels than would normally be the case.

**Sealings:** duration depends on several factors such as dragging speed, temperature, ambient conditions, etc.; as a rough guide; it can vary from  $3\,150$  to  $25\,000 \text{ h}$ .

**Warning:** for gear reducers sizes 100 ... 250, before unscrewing the filler plug with valve (symbol ) wait until the unit has cooled and then open with caution.

## 4.3 - Shaft-mounting arrangements

The strength and shape of the housing offer: **advantageous** possibilities for shaft mounting even – for instance – in the case of gearmotor with belt drive.

A few shaft mounting arrangements are shown here with the relative details as to selection, and installation.

In ch. 3.4 are shown the shaft-mounting arrangements which **can be supplied**.

**IMPORTANT.** When shaft mounted, the gearmotor must be supported both axially and radially by the shaft end of the driven machine, as well as anchored against rotation only, by means of a reaction having **freedom of axial movement** and sufficient **clearance in its couplings** to permit minor oscillations – always in evidence – without provoking dangerous overloads on the actual gearmotor. Pivots and components subject to sliding have to be properly lubricated; we recommend the use of a locking adhesive such as LOCTITE 601 when fitting the bolts.

For sizes 32 ... 126 can be supplied (ch. 3.4) a semi-flexible and economical reaction arrangement, with bolt using disc springs.

Semi-flexible reaction arrangement for sizes 63 ... 250 (ch. 5) using disc springs and bracket.

Rigid reaction arrangement for variable-distance anchorage for sizes 63 ... 250 (ch. 5) using a torque arm. Where direction of rotation is opposite to the one shown in the drawing, turn the torque arm through 180°.

Similar to the previous arrangement for sizes 100 ... 250 (ch. 5), but using a flexible torque arm; safety devices may be installed to prevent accidental overloads. The flexible torque arm may be turned through 180° regardless of direction of rotation.

UTC 748

Reaction arrangement using torque arm, fitted onto B14 flange, with plastic damping bush (see ch. 5).

For the majority of normal cases, where weight force  $G$  is orthogonal or parallel to reaction  $R_R$  as illustrated in the drawings, reactions are calculated thus:

1) reaction  $R_R$  [daN] produced by support R:

$$R_R = (1 / x_R) \cdot [G \cdot x + (\pm M_2)]$$

2) bending moment  $M_{iA}$  [daN m] through the cross-section of bearing A:

**A**  $M_{iA} = [G \cdot (y + s)] - [(\pm R_R) \cdot s]$

**B**  $M_{iA} = \sqrt{[G \cdot (y + s)]^2 + [R_R \cdot s]^2}$

3) bearing A radial reaction  $R_A$  [daN]:

**A**  $R_A = \frac{1}{l} \{ [G \cdot (y + s + l)] - [(\pm R_R) \cdot (s + l)] \}$

**B**  $R_A = \frac{1}{l} \sqrt{[G \cdot (y + s + l)]^2 + [R_R \cdot (s + l)]^2}$

4) bearing B radial reaction  $R_B$  [daN]:

$$R_B = \frac{M_{iA}}{l}$$

- where:
- $G$  [daN]: weight force almost equal numerically to gearmotor mass (ch.3.8);
  - $M_2$  [daN m]: output torque expressed by + or - according to the direction of rotation in the drawing;
  - $x$  [m]: dimension to  $x = G + 0,2 \cdot Y$  (ch. 3.8);
  - $y$  [m]: dimension  $y = 0,5 \cdot B$  (ch. 3.8);
  - $x_R$  [m] (for reaction bolt with disc spring): dimension  $x_R = 0,5 \cdot A$  (drawing on the left) or  $x_R = H + S$  (drawing on the right) (ch. 3.8 and 5);
  - $x_r$  [m] (for torque arm): see table at ch. 5;
  - $l, s$  [m]: dimension  $s$  must be as short as possible.

## 4.4 - Motor replacement

As all gearmotors are fitted with **standard** motors, motor replacement is extremely easy. Simply observe the following instructions:

- be sure that the mating surfaces are machined under accuracy rating (IEC 60072-1);
- clean surfaces to be fitted thoroughly;
- in the event of a lowered keyway, replace the motor keyway with the one supplied with the gear reducer; adjust the keyway length to the motor shaft, if need be; check that between the top and the bottom of the hole keyway there is a backlash of 0,1 - 0,2 mm; in the event of output shaft keyway, lock the key by pins.

### for MR V:

- check that the fit-tolerance (push-fit) between holes hole-shaft end is G7/j6 for  $D < 28$  mm, F7/k6 for  $D > 38$  mm;
- lubricate surfaces to be fitted against fretting corrosion;

### For MR IV, 2IV

- check that the fit-tolerance (push-fit) between hole and shaft end is K6/j6 for  $D \leq 28$  mm, J6/k6 for  $D \geq 38$  mm;
- make sure that the motors have bearing location and overhang (distance S) as shown in the table;

Motor size	Min. dynamic load capacity [daN]		Max dimension 'S' mm
	Front	Rear	
63	450	335	16
71	630	475	18
80	900	670	20
90	1 320	1 000	22,5
100	2 000	1 500	25
112	2 500	1 900	28
132	3 550	2 650	33,5
160	4 750	3 350	37,5
180	6 300	4 500	40
200	8 000	5 600	45
225	10 000	7 100	47,5

- assemble on motor shaft, as follows:
  - the **spacer** pre-heated at **65 °C** sealing the motor shaft part with **locking adhesive type LOXEAL 58-14** and ensuring that between keyway and motor shaft shoulder there is a ground cylindrical section of at least 1,5 mm; pay attention **not to damage the external surface of spacer**;
  - the **key** in the keyway, taking care that a brief segment of at least 0,9 times the pinion width;
  - the pinion pre-heated at **80 ÷ 100 °C**;
  - the **axial fastening system** where foreseen (head self-locking screw with base, spacer, or hub clamp with one or more dowels, fig. a); for the cases foreseen **without axial fastening** (fig. b), seal with **locking adhesive type LOXEAL 58-14** also the motor shaft section below the **pinion**;
- in the event of axial fastening system with hub clamp and dowels, be sure that these ones do not overhang from spacer external surface: screw the dowel and matrix the motor shaft with a tip;
- grease the pinion teeth, the sealing ring rotary seat and the seal ring (with KLÜBER Petamo GHY 133N), and assemble carefully, **paying attention not to damage the seal ring lip due to accidental shock with the pinion toothing**.

## 5.1 - Low speed shafts

Supplementary description when ordering by **designation: standard**, or **double extension low speed shaft**

Gear reducer size	D Ø	E	D <sub>1</sub> Ø	h	L <sub>1</sub>	L <sub>2</sub>	l	2 Z	Bolt	Mass	
										Standard	Double extens.
32	19 h7	30	28	4	108	138	36	78	M 6 × 20	0,3	0,4
40	24 h7	36	35	5	128	164	45	92	M 8 × 25	0,6	0,7
50	28 h7	42	35	5	148	190	63	106	M 8 × 25	0,8	1
63, 64	32 h7	58	47	5	184	242	70	126	M 10 × 30	1,2	1,5
80	38 h7	58	47	5	208	266	90	150	M 10 × 30	1,9	2,4
81	40 h7	58	47	5	208	266	90	150	M 10 × 30	2,1	2,7
100	48 h7	82	57	6	262	344	110	180	M 12 × 40	3,7	4,9
125, 126	60 h7	105	82	8	317	422	140	212	M 16 × 45	7	9,4
160	70 j6	105	82	8	355	460	180	250	M 16 × 45	11	14
161	75 j6	105	82	8	355	460	180	250	M 16 × 45	12,6	16
200	90 j6	130	102	10	430	560	200	300	M 20 × 60	21	28
250	110 j6	165	135	12	525	690	250	360	M 24 × 60	39	51

The shoulder outer diameter of the part, or of spacer abutting with the gear reducer must be  $(1,25 \div 1,4) \cdot D$ .

## 5.2 - Solid low speed shaft (size 250)

In order to permit the high radial loads given in the catalog (250 bis), the gear reducer size 250 can be supplied with solid low speed shaft and strengthened bearings. Dimensions remain unchanged (missing the washer on shaft end).

Supplementary description when ordering by **designation: solid low speed shaft pos. 1** or **2** or **double extension**.

## 5.3 - Oversized hollow low speed shaft

The gear reducers and gearmotors sizes 32 ... 64 and 100 can be supplied with oversized hollow low speed shaft; dimensions are according to table on the left.

Gear reducer size	D Ø	Parallel key b x h x l*	Keyway		
			b	t	t <sub>1</sub>
32	20	6 × 6 × 36	6	4 <sup>1)</sup>	22,2 <sup>1)</sup>
40	25	8 × 7 × 45	8	4,5 <sup>1)</sup>	27,7 <sup>1)</sup>
50	30	8 × 7 × 63	8	5 <sup>1)</sup>	32,2 <sup>1)</sup>
63 <sup>2)</sup> , 64 <sup>2)</sup>	35	10 × 8 × 90	10	6 <sup>1)</sup>	37,3 <sup>1)</sup>
100	50	14 × 9 × 110	14	5,5 <sup>1)</sup>	53,8

\* Recommended length.

1) Not unified values.

2) Without circlip groove.

Supplementary description when ordering by **designation: oversized hollow low speed shaft**

## 5.4 - Flange

B5 flange having clearance holes and spigot «recess».

Available in 2 different options with different mating dimensions: **B5 flange** and **B5 flange Type B**

The accessory is supplied fitted onto the gear reducer. If not differently stated, the standard mounting position is on the gear reducer right side - seen from motor side. For reverse mounting, specify in designation «**mounted on opposite side**».

Locking adhesives are recommended both around threads and on mating surface.

### B5 flange

Grandezza riduttore Gear reducer size	F Ø	G Ø	H <sub>1</sub> h12	H <sub>2</sub> h12	M Ø	N Ø	P	Q	S	V Ø	Z	Massa Mass kg

<b>80, 81</b>	14	110	74,5	129	230	170	280	6	121	16	75	5,8

Supplementary description when ordering by **designation: flange B5 or B5 flange type B**.

In case of separate order from the gear reducer's one, the accessory designation must include the catalog and reducers size data.

## 5.5 - Torque arm

See technical explanations at ch. 4.

The accessory, including fixing bolts for gear reducer, is supplied not assembled. Fitting towards motor is not possible.

Gear reducer size	A	B	C	d Ø	H <sub>1</sub> h11	m h12	n	s	s <sub>1</sub> ≈	x <sub>R</sub> m	M <sub>2</sub> daN m
<b>32</b>	100	45	157	8 <sup>1)</sup>	31,5	5	9	4	4,7	0,100	9,5

- 1) Plastic damping bush not present.
- 2) Position not possible for MR V 32 ... 50, MR IV 32 ... 81

Supplementary description when ordering by **designation: torque arm**.

## 5.6 - Hollow low speed shaft Standardfit protection

Protection hollow low speed shaft free area, made of plastic (polypropilene PP material color black)

The accessory is supplied disassembled and complete with fastening screws. We recommend the use of locking adhesive on the screws.

Gear reducer size	P Ø	P <sub>0</sub> Ø	X	s H11	Screws UNI 5931	M <sub>tightening</sub> N m
<b>32</b>	90	48	20,5	1,5	M5x14	1,5
<b>40</b>	105	50	20,5	1,6	M6x18	2,8
<b>50</b>	120	61	24	1,7	M6x18	2,8
<b>63, 64</b>	120	61	24	1,7	M8x20	6,3
<b>80, 81</b>	160	78	27,5	1,8	M10x20	12,3

- 1) Tightening torque.

Non standard design code for designation:

### Hollow low speed shaft STANDARDFIT protection

In case of separate order from the gear reducer's one, the accessory designation must include the catalog and gear reducers size data.

## 5.7 - Strengthened low speed shaft bearings

Gear reducers and gearmotors sizes 63 ... 126 can be supplied with taper roller bearings supporting the low speed shaft, allowing increased radial and/or axial loads. Values for sizes 100 ... 126 are given in ch. 3.12, other values, consult us.

Supplementary description when ordering by **designation: strengthened low speed shaft bearings**.

## 5.8 - Strengthened high speed shaft bearings

Gear reducers R IV sizes 80 ... 126 with  $i_N \leq 160$  can be supplied with cylindrical roller bearings supporting the high speed shaft allowing increased radial loads, values **x 1,6** for sizes 80 ... 100, **x 1,4** for sizes 125 and 126 (ch. 3.11); this design is standard for sizes 160 ... 250.

Supplementary description when ordering by **designation: strengthened high speed shaft bearing**.

## 5.9 - Controlled or reduced backlash

Gear reducers and gearmotors with worm gear pair **controlled or reduced backlash**.

Values are 1/2 (controlled backlash) or 1/4 (reduced backlash) those stated on ch. 3.13; reduced backlash designed not possible for R V and MR V with input speed  $n_1 > 1\,400 \text{ min}^{-1}$ .

Supplementary description when ordering by designation: **controlled backlash** or **reduced backlash**.

## 5.10 - Hollow low speed shaft washer

All gear reducers and gearmotors can be supplied with washer, circlip (excluding sizes 32 ... 50), bolt for axial fastening and protection cap (ch. 4).

Supplementary description when ordering by **designation: hollow low speed shaft washer**.

## 5.11 - Hollow low speed shaft washer with locking rings or bush

All gear reducers and gearmotors can be supplied with washer, circlip (excluding sizes 32 ... 50), locking rings (sizes 32 ... 50) or locking bush (sizes 63 ... 250), bolt for axial fastening and protection cap (ch. 4).

Supplementary description when ordering by **designation: hollow low speed shaft washer with locking rings** or **bush**.

## 5.12 - Hollow low speed shaft protection

Gear reducers and gearmotors, sizes 32 ... 161, can be supplied with only the protection cap for the area not utilized by the hollow low speed shaft (ch. 4).

Supplementary description when ordering by **designation: hollow low speed shaft protection**.

## 5.13 - Shaft-mounting arrangements

See technical explanations at ch. 4.

For dimensions **A**, **B** see ch. 3.6 and 3.8.

Gear reducer size	Bolt	Disc spring	T	F Ø	R 1)	$M_2 \leq$ 2)
	UNI 5737-88	DIN 2093				daN m
<b>32</b>	M 6 × 40	A 18 n. 2	8 ÷ 10	8	4,9	—
<b>40</b>	M 8 × 55	A 25 n. 2	10 ÷ 14	11	6,5	—
<b>50</b>	M 8 × 55	A 25 n. 2	10 ÷ 14	11	6,5	20

## 5.14 - Gear reducer design ATEX II 2 GD and 3 GD

Worm gear reducers and gearmotors may be supplied according to European Community Directive ATEX 2014/34/EU in order to be used in potentially explosive atmospheres - category **2 GD** (for operation in zones 1 (gas), 21 (dust): presence of **probable** explosive atmosphere) and **3 GD** (for operation in zones 2 (gas) 22 (dust): **improbable** presence of explosive atmosphere) with surface temperature 135 °C (T4). These are the main variations of the product:

- fluoro-rubber seal rings;
- metal plugs; filler plug with filter and valve;
- special name plate with ATEX mark and indication of application limits;
- external protection based on a water-soluble dual-compound polyacrylic **conductive** enamel, **color grey** RAL 7040, corrosivity class C3 ISO 12944-2;
- «ATEX Instructions» manual.

For category 2 GD, depending on **minimum control intervals**, also

- 2 GD monthly control
  - double seal rings on low speed shaft;
- 2 GD quarterly control (sizes 200, 250)
  - double seal rings on low speed shaft (size  $\geq 63$ );
  - oil temperature probe;

this solution is advisable when the gear reducer has difficult access or when a decrease in control frequency is required.

Operating ambiente temperature:  $-20 \div +40$  °C.

The «**ATEX Operating instructions**» (with the additional documentation, if any) are **integral part of the supply of each gear reducer**, every indication stated in it must be carefully applied. In case of necessity consult us.

### Gear reducer size selection

Determine the size of gear reducer as indicated in ch. 6 considering following additional limitations:

- a) maximum input speed  $n_1 \leq 1\,500$  min<sup>-1</sup>.
- b) **service factor requested** determined according to ch. 6 increased with the factors stated in the following table - **never lower than 0,85**.

Verify, at last, that the **applied power**  $P_1$  is lower than or equal to nominal thermal power  $P_{tN}$  multiplied by thermal factors  $f_{t_2}^{(1)} \dots f_{t_5}$  (see ch. 3.2) and by corrective factor  $f_{ATEX}$  given in the following table.

ATEX design **corrective factors** for required service factor **fs** and nominal thermal power  $P_{tN}$ .

ATEX category	$f_{ATEX}$	$f_{ATEX}$
<b>2GD</b>	1,18	0,8
<b>3GD</b>	1,06	0,9

### Motor category selection

In the table on the right the minimum features of motors to be installed with Rossi gear reducers in ATEX design, in potentially explosive atmosphere areas.

Protection methods of electric tools:

- EEEx **e** increased safety;
- EEEx **d** flameproof enclosure;
- EEEx **de** combination of «d» and «e»;
- EEEx **nA** reduced sparking

Zone	Rossi Gear reducer ATEX II design	Required motor category <sup>1)</sup>
<b>1</b>	2 GD	2 G EEx e 2 G EEx d 2 G EEx de
<b>21</b>		2 D IP65
<b>1, 21</b>		2 GD EEx e 2 GD EEx d 2 GD EEx de
<b>2</b>	3 GD	3 G EEx nA –
<b>22</b>		3 D IP54 <sup>2)</sup> –
<b>2, 22</b>		3 GD EEx nA

1) The devices suitable for zone 1 are also suitable for zone 2, similarly the devices suitable for zone 21 are also suitable for zone 22.

2) For conductive dusts motor must be 2 D IP65.

Additional description when ordering by **designation**:

**Design ATEX II ...**

... **3 GD T4** sizes 32 ... 250

... **2 GD T4 monthly control** sizes 32 ... 250

... **2 GD T4 quarterly control** sizes 200, 250

2) For gearmotors, this designation refers to the only **gear reducer part**

## Miscellaneous

- Expansion tank for continuous duty and high speed running of gear reducers and gearmotors **IV 100 ... 250** and **2IV 100 ... 126** mounting position **B6**.
- Gear reducers and gearmotors sizes **100 ... 250** supplied **filled with synthetic oil**.
- Gearmotors with:
  - **brake motor** (also single-phase) with d.c. **safety and/or parking brake** (sizes 63 ... 132) having overall dimensions nearly the same of a standard motor and braking torque  $M_f \geq M_N$ , maximum economy;
  - **two-speed motor** (standard motor, brake motors, brake motors with safety and/or parking brake, with flywheel) 2.4, 2.6, 2.8, 2.12, 4.6, 4.8, 6.8 poles;
  - **brake motor for traverse movements**: 2, 2.4, 2.6, 2.8, 2.12 poles (always with low noise d.c. brake, see picture);

- motor featuring: d.c. supply; single-phase; explosion-proof; with second shaft end; with non-standard protection, voltage and frequency; provided with devices against overloads and overheating;
- **motor without fan cooled by natural convection** (size 63 ... 112); design for textile industry.
- Gear reducers and gearmotors with **mechanical torque limiter** on **output** shaft, gear reducer sizes **32 ... 160** (excluding size 81).
- Gear reducer design with mechanical **friction** type torque limiter (friction surfaces without asbestos), compact and with high transmissible torque — up to **300 daN m** — and top quality standards.
- It protects the drive from accidental overloads by excluding the effect of inertia loads transmitted from up-line masses and, also if the gear reducer is irreversible (the torque limiter being mounted on the output shaft), inertia loads transmitted from down-line masses.
- When the transmitted torque tends to exceed the setting value the drive «slips» although it **remains** engaged with torque equal to the limiter setting value; slipping stops as soon as the load returns to normal; in the case of very brief overloads the driven machine will continue normal operation (after decelerating or stopping) without requiring reset procedures.

External limiter mounting

Intermediate limiter mounting

Limiter mounting onto combined units

The system, as the unit is mounted externally to the gear pair, will not alter if the direction of rotation changes and it does not affect the rigidity and meshing precision between worm and worm wheel (this is important to ensure the correct transmission of torque and the limitation of undue backlash between teeth through time). The system also permits **shaft mounting** with the limiter mounted **externally** (easily accessible) or in the **intermediate** position (better safety protection). It can be interposed, in the **combined units**, between initial worm gear reducer and final worm gear reducer, sizes **100 ... 250**.

On request slide detector. For more details see **specific literature**.

– **MLA unit, mechanical torque limiter on input shaft**, motor sizes **80 ... 200**.

Mechanical torque limiter unit to be interposed between gear reducer and B5 mounting position motor standardized to IEC or (wide belt or planetary motor-variator) or, in **combined units**, between the initial gear reducer and the final worm gear reducer, sizes **50 ... 250**.

Axially ultra-compact design: excellent load bearing with life lubricated double row angular contact ball bearings (motor size  $\leq 112$ ) or «O» disposed taper roller bearings.

The unit protects the drive from accidental overloads by excluding inertia loads transmitted from up-line masses and if the gear reducer is reversible (the torque limiter being on the input shaft), inertia loads transmitted from down-line masses.

**LA unit is friction type** (friction surfaces without asbestos). When the transmitted torque tends to exceed the setting, the drive «slips» although **it remains** engaged and transmits torque equal to the limiter setting value; slipping stops as soon as the load returns to normal; in the case of very brief overloads the driven machine will continue normal operation (after decelerating or stopping) without requiring reset procedures.

On request slide detector. For more details see **specific literature**.

\* on request

- Semi-flexible and hydrodynamic couplings.
- Special paints
- Special seal rings; **double seal** (excluding sizes 32 ... 50).
- For high transmission ratios combined units can be also obtained with initial gearmotor **MR IV** with final gear reducer size  $\leq 81$  and with initial gearmotor **MR 2IV** for final gear reducer size  $\geq 100$ .

# Technical formulae

Main formulae concerning mechanical drives, according to the Technical System and International Unit System (SI).

Size	Con unità Sistema Tecnico With Technical System units	Con unità SI With SI units
starting or stopping <b>time</b> as a function of an acceleration or deceleration, of a starting or braking torque	$t = \frac{Gd^2 \cdot n}{375 \cdot M} [s]$	$t = \frac{J \cdot \omega}{M} [s]$
<b>velocity</b> in rotary motion	$v = \frac{\pi \cdot d \cdot n}{60} = \frac{d \cdot n}{19,1} [m/s]$	$v = \omega \cdot r [m/s]$
<b>speed n</b> and <b>angular velocity</b> $\omega$	$n = \frac{60 \cdot v}{\pi \cdot d} = \frac{19,1 \cdot v}{d} [min^{-1}]$	$\omega = \frac{v}{r} [rad/s]$
<b>acceleration</b> or deceleration as a function of starting or stopping time		$a = \frac{v}{t} [m/s^2]$
<b>angular acceleration</b> or deceleration as a function of a starting or stopping time, of a starting or braking torque	$\alpha = \frac{n}{9,55 \cdot t} [rad/s^2]$ $\alpha = \frac{39,2 \cdot M}{Gd^2} [rad/s^2]$	$\alpha = \frac{\omega}{t} [rad/s^2]$ $\alpha = \frac{M}{J} [rad/s^2]$
starting or stopping <b>distance</b> as a function of an acceleration or deceleration, of a final or initial velocity		$s = \frac{a \cdot t^2}{2} [m]$ $s = \frac{v \cdot t}{2} [m]$
starting or stopping <b>angle</b> as a function of an angular acceleration or deceleration, of a final or initial angular velocity	$\varphi = \frac{n \cdot t}{19,1} [rad]$	$\varphi = \frac{\omega \cdot t}{2} [rad]$
<b>mass</b>	$m = \frac{G}{g} \left[ \frac{kgf \cdot s^2}{m} \right]$	$m \text{ è l'unità di massa [kg]}$ $m \text{ is the unit of mass [kg]}$
<b>weight</b> (weight force)	$G \text{ è l'unità di peso (forza peso) [kgf]} \quad G = m \cdot g [N]$ $G \text{ is the unit of weight (weight force) [kgf]}$	
<b>force</b> in vertical (lifting), horizontal, inclined motion of translation ( $\mu$ = coefficient of friction; $\varphi$ = angle of inclination)	$F = G [kgf]$ $F = \mu \cdot G [kgf]$ $F = G (\mu \cdot \cos \varphi + \sin \varphi) [kgf]$	$F = m \cdot g [N]$ $F = \mu \cdot m \cdot g [N]$ $F = m \cdot g (\mu \cdot \cos \varphi + \sin \varphi) [N]$
<b>dynamic moment Gd<sup>2</sup>, moment of inertia J</b> due to a motion of translation (numerically $J = \frac{Gd^2}{4}$ )	$Gd^2 = \frac{365 \cdot G \cdot v^2}{n^2} [kgf \cdot m^2]$	$J = \frac{m \cdot v^2}{\omega^2} [kg \cdot m^2]$
<b>torque</b> as a function of a force, of a dynamic moment or of a moment of inertia, of a power	$M = \frac{F \cdot d}{2} [kgf \cdot m]$ $M = \frac{Gd^2 \cdot n}{375 \cdot t} [kgf \cdot m]$ $M = \frac{716 \cdot P}{n} [kgf \cdot m]$	$M = F \cdot r [N \cdot m]$ $M = \frac{J \cdot \omega}{t} [N \cdot m]$ $M = \frac{P}{\omega} [N \cdot m]$
<b>work, energy</b> in motion of translation, in rotary motion	$W = \frac{G \cdot v^2}{19,6} [kgf \cdot m]$ $W = \frac{Gd^2 \cdot n^2}{7160} [kgf \cdot m]$	$W = \frac{m \cdot v^2}{2} [J]$ $W = \frac{J \cdot \omega^2}{2} [J]$
<b>power</b> in motion of translation, in rotary motion	$P = \frac{F \cdot v}{75} [CV]$ $P = \frac{M \cdot n}{716} [CV]$	$P = F \cdot v [W]$ $P = M \cdot \omega [W]$
<b>power</b> available at the shaft of a single-phase motor ( $\cos \varphi$ = power factor)	$P = \frac{U \cdot I \cdot \eta \cdot \cos \varphi}{736} [CV]$	$P = U \cdot I \cdot \eta \cdot \cos \varphi [W]$
<b>power</b> available at the shaft of a three-phase motor	$P = \frac{U \cdot I \cdot \eta \cdot \cos \varphi}{425} [CV]$	$P = 1,73 \cdot U \cdot I \cdot \eta \cdot \cos \varphi [W]$

Note. Acceleration or deceleration are understood constant; motion of translation and rotary motion are understood rectilinear and circular respectively.
